Cf. *analysis*.] The decomposition of a chemical compound into its constituent parts by an electric current.

Thus, water is decomposed by electrolysis into hydrogen and oxygen; of these it is found that the hydrogen is set free at the negative pole (the cathode), and is hence said to be *electropositive*, and is called the *cation;* while the oxygen collects at the positive pole (the anode), and is said to be *electronegative*, and is called the *anion*. A salt may also be decomposed by electrolysis: thus, copper sulphate yields metallic copper at the negative pole (upon which it is deposited), and sulphuric acid and oxygen at the positive pole. By electrolysis Davy was able to decompose lime and the other alkaline earths, and thus to show that they were compounds of metals, calcium, etc., with oxygen. An electrolysis in which the ions (a term including both anion and cation) are produced at their respective electrodes without interference from these electrodes or the surrounding electrolyte is called a *primary electrolysis*. Very often chemical changes take place between the ions and the electrodes or the electrolyte, so that the final products are different from the true ions. This is called *secondary electrolysis*.

Electromagnet.

electromagnet (ē-lek-trō-mag'net), *n.* A magnet which owes its magnetic properties to the inductive action of an electric current. If an insulated wire is wound about a bar

of soft iron and a current of electricity is passed through it, the bar becomes a temporary magnet with a north and a south pole; the end at which the current circulates through the wire in the direction of the hands of a clock, as the observer looks at it, is the south pole. In practice, an electromagnet has ordinarily a horseshoe form. It consists of two cylinders, or cores, of soft iron, fastened together at one end and each wound many times with insulated wire; the wire must be so wound that if the horseshoe were straightened the direction of winding would be the same throughout. An electromagnet may be made very powerful, so as to support a ton or more. The soft iron core retains its maximum magnetization only so long as the current is passing, and loses nearly all of it the instant the current ceases. This principle is made use of in the telegraph (which see), electric clocks, electric call-bells, etc. If the core is made of steel, it becomes under the action of the current a permanent magnet.

It comprises the effects of an electric current in directing a magnetic needle and in inducing magnetism in a magnetic substance, as soft iron, and also the analogous effects of a magnet in directing a movable conductor traversed by a current, or in inducing in a conductor an electric current. The directive power of an electric current upon a magnet was discovered by Oersted; it is the principle involved in all forms of galvanometer (which see). The power of an electric current to induce magnetism, and of a magnet to induce an electric current, is treated under *induction;* these latter phenomena form the basis of the electromagnet and of all forms of magneto-electric and dynamo-electric machines.

★**electrometallurgy** (ē-lek-trō-met′al-ėr-ji), *n.* The application of electricity to the art of producing and utilizing the metals. The most important applications are: The separation of metals for their ores, which cannot, or not as well, be separated otherwise, as aluminium, magnesium, sodium, silicon; or of metallic alloys, as ferrotitan, ferrowolfram, etc.; the refining of metals, as copper, etc.; the application of the metals in the arts, in electroplating, that is, covering metals with copper, silver, gold, nickel, iron, etc., and electrotyping, that is, making copies of cuts, engravings, etc., usually in copper. The electric current is used either by its direct chemical action, in electrolysis (see *electrolysis*), or by its heating action, in the electric furnace. In electrolysis a direct current is required and applied either to a solution of the metal to be used, in copper refining, electrotyping, and electroplating, or to a fused compound, as in aluminium reduction. The electrothermal action of the electric current is used mainly when temperatures are needed higher than can be produced by combustion, as in the reduction, by carbon, of very refractory metals, as titanium, wolfram, and their alloys.

★**electrometer** (ē-lek-trom′e-tėr), *n.* [= D. G. Dan. Sw. *elektrometer* = F. *électromètre* = Sp. *electrómetro* = Pg. *electrometro* = It. *elettrometro*, < Gr. ἤλεκτρον, amber (repr. electricity), + μέτρον, a measure.] An instrument for measuring difference of electrostatic potential between two conductors. See *potential*. There are many forms. The *absolute electrometer* (also called *balance-electrometer*) of Sir William Thomson consists essentially of two parallel circular plates attracting each other, the central portion of one of them, the upper, suspended from one arm of a balance or by means of light steel springs, the other being movable to a greater or less distance from the first by means of a micrometer screw. The upper disk is always brought to a fixed position (which can be very accurately determined) by means of the attraction of the lower, the amount of attraction being regulated by the distance between the two plates. It is thus seen that the electric force is actually weighed, and formulas are given by means of which the difference of potentials is deducible in absolute measure, the areas of the plates and the distance between them being known. The *quadrant electrometer* of Sir William Thomson consists of four quadrant-shaped pieces of metal, sometimes segments of a flat cylindrical box, the alternate pairs being connected by a wire; above or within this, if the cylindrical form is used, a flat needle of aluminium is hung by a delicate wire. The needle is kept in a constant electrical condition by connection usually with a Leyden jar placed above or below, and if the two pairs of quadrants are dissimilarly electrified—that is, are in a state of different potential, as by connecting them respectively with the poles of a voltaic cell—the needle is deflected from its position of rest, and the amount of this deflection, as measured by the motion of a spot of light reflected from a small mirror attached to it, gives a means of calculating the difference of potential of the bodies under experiment. In another method of using the quadrant electrometer the pairs of quadrants are kept at a constant difference of potential, while that of the needle varies. Arranged in this manner, it is much used in the investigation of atmospheric electricity. Lippmann and Dewar have devised very delicate capillary electrometers, based on the alteration of the force of capillarity by electric action. See *electrocapillary*.

★**electromotive** (ē-lek-trō-mō′tiv), *a.* Of or pertaining to electromotion; producing or produced by electromotion.—**Electromotive force** (abbreviated *E. M. F.*), that which determines the flow of electricity from one place to another, giving rise to an electric current. It is the result of, and proportional to, the difference of electric potential (see *potential*) between two bodies, or parts of the same body, and bears a similar relation to it that the pressure in a water-pipe does to the difference of water-level upon which its amount depends. The strength of an electric current is directly proportional to the electromotive force, and inversely proportional to the resistance (Ohm's law). The electromotive force is measured in volts.—**Electromotive series,** the series of the various metals (or other substances) useful for producing an electric current, arranged in such an order for a given liquid that each is positive with reference to those which follow in the list, and negative for those which precede. For example, in dilute sulphuric acid the order is zinc, lead, iron, copper, silver, platinum, carbon—that is, if zinc and iron are coupled together in a voltaic cell containing sulphuric acid, the zinc is the positive plate, and the current goes in the wire from iron to zinc; if iron and copper are taken, the current in the wire is from copper to iron. It is found that the electromotive force is a maximum for zinc and carbon, and is equal to the sum of the electromotive forces for all the intervening metals. In another liquid the order would be changed, but the above law would hold true; for example, in potassium sulphid, iron is electro-negative with reference to copper. Also called *contact series*.

electromotograph (ē-lek-trō-mō′tō-gràf), *n.* A name sometimes applied to a peculiar telephone-receiver invented by Edison. electrophone (ē-lek′trō-fōn), *n.* [< Gr. ἤλεκτρον, amber (repr. electricity), + φωνή, voice, sound.] An instrument for producing sounds, resembling trumpet-tones, by electric currents of high tension. It has been recommended for use as a telegraphic relay capable of giving two or four signs with a single wire, having this advantage over other relays, that perfection of contact is not necessary to its working. It has been used also to indicate the electric equilibrium of muscle and nervous tissue by the variation of its tones, and by a system of levers attached to the wrist to show the rhythm and character of the pulse; and it may be fitted to the telephone, and thus be made to repeat a sound made gently in one place in trumpet-tones in another place hundreds of yards distant. *Chambers's Encyc.*

Pl. *electrophori* (-rī). An instrument for obtaining statical electricity by means of induction. It consists of a disk of resin, or other non-conducting material easily excited by friction, and a polished metal disk with an insulating handle. The resin disk is negatively electrified by striking or rubbing it with a catskin or flannel, and the metal plate is then laid upon it. Under these circumstances the upper plate does not receive a direct charge from the lower, but is positively charged on the lower surface and negatively on the upper; if now the disk is touched by the finger, the negative electricity passes to the ground, leaving the disk charged positively. On being lifted away by its insulating handle, it is found to be charged, and will give a spark. It may then be replaced on the lower plate, and the process repeated an indefinite number of times without any fresh excitation, if the weather is favorable. The electricity obtained each time is the equivalent of the mechanical work done in separating the two surfaces against the attraction of the unlike electricities.

electroplating (ē-lek′trō-plā-ting), *n.* **1.** The process or art of coating metals and other materials with an adherent film of metal, in a bath containing a solution of the metal, by means of the electrolytic action of an electric current from a battery or dynamo. In simple forms of electroplating apparatus, the bath containing the metallic solution may form the battery, as in plating with copper. The more common plan is to employ a current obtained from some source outside the bath. Table-cutlery or -ware, building- or car-fixtures, lamps, etc., to be electroplated, are suspended by wires from a metal rod laid across the top of the bath and connected with the negative pole of the battery, this terminal of the current forming the *cathode*. The silver, nickel, copper, etc., to be deposited is suspended in like manner from a rod connected with the positive pole of the battery, the terminal forming the *anode*. (See *electrolysis*, *electrometallurgy*.) The deposition of metals by electrolysis forms a part of several arts, as in electrotyping; but as in these the film of metal deposited in the bath is not adherent, they are described under separate heads. Electroplating is strictly the covering of a metal with a metallic film permanently attached to it, as in nickel-plating, plating telegraph-wires with copper, and table-ware with silver. See *electrotype*, *galvanoplastic*, *galvanoglyph*, *galvanograph*, and *nickel-plating*. **2.** The deposit itself, or the surface, obtained by means of the process explained above.

★**electroscope** (ē-lek′trō-skōp), *n.* [= D. *elektroscoop* = G. Dan. Sw. *elektroskop* = F. *électroscope* = Sp. *electroscopo* = Pg. *electroscopio* = It. *elettroscopio*, < NL. **electroscopium*, < Gr. *ἤλεκτρον*, amber (repr. electricity), + *σκοπεῖν*, view.] An instrument for observing or detecting the existence of free electricity, and, in general, for determining its kind. All electroscopes depend for their action on the elementary law of electric forces, that bodies similarly charged repel each other, while bodies dissimilarly charged attract each other. The simplest electroscope consists of pith-balls suspended by silk threads; another simple form consists of a pair of short pieces of straw suspended by silk threads. When not in use the pieces of straw hang down, touching each other. On presenting an electrified body to them they become excited and stand apart, thus giving a test for electricity. The gold-leaf electroscope of Bennet, introduced in 1789, consists of two pieces of gold-leaf, about ½ inch broad, fixed to a brass rod and hung inside a glass globe which has been thoroughly dried, in order that the insulation of the apparatus may be as nearly perfect as possible. The globe is closed with a wooden stopper, through the center of which passes a glass tube containing the brass rod. The

upper end of the rod is furnished with a knob. If an electrified body is brought near the top of the instrument, induction takes place; the top becomes electrified oppositely to the body presented, and the pieces of gold-leaf similarly. To find if the latter are positively or negatively charged, a glass rod is rubbed and brought near the knob; if positively charged, the leaves will diverge still more under the induction of the glass; if negatively, they will collapse, the negative electricity being attracted to the positive of the glass rod. In Volta's condensing electroscope, in place of the gilt knob there is a flat metal plate upon which rests another similar plate, which may be removed by an insulating handle.—**Quadrant electroscope**, a form of pith-ball electroscope which serves to measure roughly the degree of electrification by the rise of the pith-ball as indicated by the motion of the rod carrying it on a graduated semicircle.

From the time of Herodotus on its most common meaning in Greek was 'amber,' but it was also used for 'pure gold,' as by Sophocles. The Romans used *electrum* with the meaning of 'amber,' also as designating an alloy, which might be either natural or artificial, of silver and gold (Pliny gives the amount of silver present in electrum at one fifth of the whole). Later on, *electrum* was confounded with *orichalc* (which see), and in the middle ages had acquired the definite meaning of 'brass.' At all times, and especially among the Latin writers, there was more or less uncertainty in regard to the meaning of this word, and there was a tendency among both Greeks and Romans to use it just as *adamant* was frequently used, namely, as designating some ideal, imperfectly known substance possessed of almost miraculous properties.

elegiac (e-lē′ji-ak or el-ē-jī′ak), *a.* and *n.* [Formerly *elegiack;* = F. *élégiaque* = Sp. *elegíaco* = Pg. It. *elegiaco*, < LL. *elegiacus*, < Gr. ἐλεγειακός, < ἐλεγεία, ἐλεγεῖον, an elegy: see *elegy.*] **I.** *a.* 1. In *anc. pros.*, an epithet noting a distich the first line of which is a dactylic hexameter and the second a pentameter, or verse differing from the hexameter by suppression of the arsis or metrically unaccented part of the third and the sixth foot, thus:

Verses or poems consisting of elegiac distichs are called *elegiac verses* or *poems* (*elegiacs*); poetry composed in this meter, *elegiac verse* or *poetry* (*the elegy*); and the writers who employed this verse, especially those who employed it exclusively or by preference, are known as the *elegiac poets.* Elegiac verse seems to have been used primarily in threnetic pieces (poems lamenting or commemorating the dead), or to have been associated with music of a kind regarded by the Greeks as mournful. Almost from its first appearance in literature, however, it is found used for compositions of various kinds. The principal Roman elegiac poets are Catullus, Tibullus, Propertius, and Ovid. In modern German literature the elegiac meter has been frequently used, especially by Goethe and Schiller. Coleridge's translation from the latter poet may serve as an example in English.

In the hex | ámeter | rises the | fóuntain's | sílvery | cólumn,
In the pen | támeter | áye ‖ fálling in | mélody | báck.

Sw. *element*, < L. *elementum*, a first principle, element, rudiment, pl. first principles, the elements (of existing things), the elements of knowledge, the alphabet; origin uncertain. The common derivation of the word from *alere*, nourish, which would identify *elementum* with *alimentum*, nourishment (see *aliment*), is wholly improbable. Several other derivations have been proposed, of which one assumes the orig. sense to be 'the alphabet,' the 'A-B-C,' or lit. the 'L-M-N,' the word being formed, in this view, < *el* + *em* + *en*, the names of the letters L, M, N, + the term. *-tum*, as in the common formative *-mentum*, E. *-ment.*] 1. That of which anything is in part compounded, which exists in it, and which is itself not decomposable into parts of different kinds; a fundamental or ultimate part or principle; hence, in general, any component part; any constituent part or principle.

(*c*) In *geom.*, one of the points, lines, or planes, or other geometrical forms, by which a figure or geometrical construction is made up. "Space may be considered as a geometrical figure whose elements are either points or planes. Taking the points as elements, the straight lines of space are so many ranges, and the planes of space so many planes of points. If, on the other hand, the planes are considered as elements, the straight lines of space are the axes of so many axial pencils, and points of space are centers of so many sheaves of planes" (*Cremona*, Geom., tr. by Leuesdorff, § 31). (*d*) In *math.*, one of a number of objects arranged in a symmetrical or regular figure. The elements of a determinant are the quantities arranged in a square block or matrix, the sum of whose products forms the determinant. (*e*) In *astron.*, one of the quantities necessary to be known in calculating the place of a planet. They are seven, namely, the longitude of the ascending node, the inclination of the orbit to the ecliptic, the longitude of the perihelion, the eccentricity, the mean distance from the sun, the mean longitude at some given epoch, and the period, or else the mean daily motion. Hence—(*f*) A datum required for the solution of any problem. (*g*) *pl.* The bread and wine used in the eucharist: distinctively called *communion elements.*

When all have communicated, the Bishop shall return to the Lord's Table, and reverently place upon it what remaineth of the consecrated *Elements*, covering the same with a fair linen cloth.
Book of Common Prayer, Holy Communion.

(*h*) In *biol.*, one of the primary or embryological parts composing the body of an animal, or of the pieces which have united to form any part. Thus, the thorax of an insect is composed of three principal *elements* or rings, the epicranium is formed of several *elements* or pieces which are soldered together, etc. (*i*) In *elect.*, a voltaic cell. See *cell.*

The bichromate of potassium batteries, composed of four troughs with six compartments, making twenty-four *elements* in circuit. A mercury commutator enabled us to use at pleasure six, twelve, eighteen, or twenty-four *elements*, and thus to obtain four different speeds of the screw [of an electric balloon]. *Science*, III. 154.

2. One of the four things, fire, water, earth, and air (to which ether was added as a fifth element), falsely regarded by the ancients as the constituents of which all things are composed. Water, as an element, consists of all that is in the rain, the rivers, the sea, etc.; fire, of lightning, the sun, etc.; these, together with the air and earth, were supposed to make up the matter of nature. *The elements* often means in a particular sense wind and water, especially in action: as, the fury of *the elements.*

"It is a water that is maad, I seye,
Of *elementes* foure," quod Plato.
Chaucer, Canon's Yeoman's Tale (ed. Skeat), G. l. 1460.

Of the four *elements.* *Massinger*, Renegado, iii. 2.

And, lost each human trace, surrendering up
Thine individual being, shalt thou go
To mix forever with the *elements.*
Bryant, Thanatopsis.

3. A kind of matter undecomposable into other kinds. The elements as enumerated by Empedocles, and generally recognized in antiquity, were four—fire, water, earth, and air. (See 2.) The older chemists, of the fifteenth century and later, recognized three elements—sulphur, mercury, and salt. In modern chemistry an element, or elementary body, is regarded merely as a simple substance which has hitherto resisted analysis by any known chemical means. The list of such elements is a provisional one, since it is possible, and not improbable, that many bodies now considered elementary may be proved to be compound. There are at present 83 elements recognized by chemists, commonly divided into two groups, namely, *metals* and the *non-metallic bodies* or *metalloids.* The non-metallic elements are hydrogen, chlorin, bromine, iodine, fluorin, oxygen, sulphur, selenium, tellurium, nitrogen, phosphorus, arsenic, antimony, bismuth, boron, silicon, and carbon. (See *metalloid.*) The remaining elements are regarded as metals. (See *metal.*) Five of the elements, oxygen, nitrogen, hydrogen, chlorin, and fluorin, are gases at ordinary temperatures; two, bromine and mercury, are liquids; the rest are solids. The properties of all the elements bear a close relation to their atomic weights. (See *periodic law*, under *periodic.*) The following is a list of the elements with symbols and atomic weights.

It. *elemi;* of Eastern, said to be of Ar., origin.] A name of fragrant resins of various kinds, all of them probably the product of trees belonging to the family *Balsameaceæ*. The Oriental or African elemi of the older writers is an exudation from *Boswellia Frereana*, a tree found in the region south of the Gulf of Aden. It is used in the East for chewing, like mastic. Also *elenchus.*

Reprehension or *elench* is a syllogism which gathereth a conclusion contrary to the assertion of the respondent.
Blundeville (1609).

The sophistical *elenchus* or refutation, being a delusive semblance of refutation which imposes on ordinary men and induces them to accept it as real, cannot be properly understood without the theory of *elenchus* in general; nor can this last be understood without the entire theory of the syllogism, since the *elenchus* is only one variety of syllogism. The *elenchus* is a syllogism with a conclusion contradictory to or refutative of some enunciated thesis or proposition. Accordingly we must understand the conditions of a good and valid syllogism before we study those of a valid *elenchus;* these last, again, must be understood, before we enter on the distinctive attributes of the pseudo-*elenchus*— the sophistical, invalid, or sham, refutation. *Grote.*

Ignorance of the elench. See *fallacy of irrelevant conclusion*, under *fallacy.*

In such elevators the elevator proper, or lifter, is a continuous band of leather studded with metal cups or elevator-buckets, passing over a pulley at the top of the building and under a second pulley on the elevator-boot, or the foot of an inclosed tube called the *elevator-leg* (see *leg*). In some instances the elevator-leg is pivoted at the top, so that it may swing clear of the building and reach into the hold of the vessel or car to be emptied. The structure itself consists of a nest of deep bins, into which the grain is directed by spouts from the top of the lifter. The capacity of such elevators is often one and a half million bushels or more. For the horizontal movement of grain in elevators,

conveyers are used. Lifting elevators are also used in flour-mills, grinding-mills, furnaces, and other works, to handle materials of all kinds in bulk, as sand, ashes, ice, etc.

Such elevators are used to transfer grain from barges to the holds of ships.—**Hydraulic elevator,** an elevator operated by some kind of hydraulic apparatus. For short lifts the hydraulic press is sometimes used, particularly where the weight to be raised is great. Another form, for light loads and moderate heights, is a telescopic tube supporting the car at the upper end. On filling the tube with water under pressure it expands and raises the car; to lower it, the supply of water is cut off, and that in the tube is allowed to escape. The most common form of hydraulic elevator in the United States is that of a car lifted by ropes, operated by a piston in a long cylinder. The rope is connected directly with the piston-rod, which is moved by the admission of water under pressure. In some instances the cylinder is horizontal and the travel of the piston limited, multiplying gear being fitted to the rope. The usual form is an upright cylinder with a very simple form of rope-gearing.—**Pneumatic elevator,** a hoisting or lifting apparatus worked by compressed air; a pneumatic hoist.

Burton, Anat. of Mel., p. 20.

The flesh which was included five weeks ago was this day found very good. I do not doubt but that perfect *elixation* was able to contribute something to its preservation, because the sundry principles of which flesh consisteth had, whilst the heat continued, exerted their strength upon one another far better than if, the flesh being less boiled, by reason of the great avolation of parts, had been removed from the fire, as happens in ordinary coctions.

★**elixir** (ē-lik′sẹr), *n.* [Formerly also *elixar*; < ME. *elixir* = D. *elixer* = Sw. Dan. The *great elixir*, also called the *philosopher's stone*, or the *red tincture*, when shaken in very small quantity into melted silver, lead, or other base metal, was said to transmute it into gold. In minute doses it was supposed to prolong life and restore youth, and was then called the *elixir vitæ*. The *lesser elixir, stone of the second class*, or *white tincture*, was regarded as having these qualities in lesser degree; thus it transmuted baser metals into silver. The word is now often used figuratively.

A! nay! lat be; the philosophres stoon,

The air we breathed was an *elixir* of immortality.
B. Taylor, Lands of the Saracen, p. 89.

2. In *med.*, formerly, a tincture with more than one base; in modern pharmacy, an aromatic, sweetened, spirituous preparation containing small quantities of active medicinal substances. The first object sought in the modern elixir is an agreeable taste, and usually this is attained only by such sacrifices as to render the effect of the medicine almost nil.
U. S. Dispensatory, p. 537.

3. The inmost principle; absolute embodiment or exemplification. [Rare or obsolete.]

She is not such a kind of evil as hath any good or use in it, which many evils have, but a distill'd quintessence, a pure *elixar* of mischief.

Paracelsus declared them an elixir made of aloes, saffron, and myrrh would prove a vivifying and preserving balsam, able to continue health and long life to its utmost limits; and hence he calls it by the lofty title of *elixir of propriety* to man; but concealed the preparation, in which Helmont asserts the alcahest is required.
P. Shaw, Chemistry, Process 81.

★**Elizabethan** (ē-liz-a-beth′an), *a.* Of or pertaining to Elizabeth (daughter of Henry VIII. and Anne Boleyn), Queen of England from 1558 to 1603, or to her times.

A new crop of geniuses like those of the *Elizabethan* age may be born in this age, and, with happy heart and a bias for theism, bring asceticism, duty, and magnanimity into vogue again. *Emerson*, in N. A. Rev., CXXVI. 417.

Elizabethan architecture, a name given to the mixed or debased architecture of the times of Elizabeth and James I., when the worst forms of the Pointed and degenerate Italian styles were combined, producing a singular heterogeneousness in detail, with, however, much picturesqueness in general effect. Its chief characteristics are: windows large, either in the plane of the wall or deeply embayed, long galleries, tall and highly decorated chimneys, and a profuse use of ornamental strapwork in parapets, window-heads, etc. The Elizabethan style is the last stage of the Tudor or Perpendicular, and, from its correspondence in period with the Renaissance of the continent, has sometimes been called the *English Renaissance.* The epithet *Jacobean* has been given to the latest variety of the Elizabethan, differing from the Elizabethan proper in showing a greater proportion of corrupt Italian forms.

Elizabethan Architecture.—Hargrave Hall, England.

The house was an admirable specimen of complete *Elizabethan*, a multitudinous cluster of gables and porches, oriels and turrets, screens of ivy and pinnacles of slate.
H. James, Jr., Pass. Pilgrim, p. 47.

Elizabethan literature, the literature produced during the reign of Queen Elizabeth, which was one of the most prolific and well-marked periods of English literary activity. It was very remarkable for the variety, vigor, and permanent value of much of its prose and verse, and especially for the great number and productiveness of its dramatic writers. The two most eminent names in this literature are those of Francis Bacon, one of the greatest of philosophers, and William Shakspere, the greatest of all dramatists.—**Elizabethan type.** Same as *church text* (which see, under *church, a.*).

The English ell, not yet obsolete, is a yard and a quarter, or 45 inches. This unit seems to have been imported from France under the Tudors; and a statute of 1409 recognizes no difference between the ell (aune) and the yard (verge). The Scotch ell was 37 Scotch inches, or 37.0958 English inches. The so-called Flemish ell differed in different places, but averaged 27.4 English inches. Other well-ascertained ells were the following: ell of Austria, 30.676 English inches; of Bavaria, 32.702 inches; of Bremen, 22.773 inches; of Cassel, 22.424 inches; of France, 47.245 inches; of Poland, 22.650 inches; of Prussia, 26.259 inches; of Saxony, 22.257 inches; of Sweden, 23.378 inches. Cf. *ellipsis.*] In *geom.*, a plane curve such that the sums of the distances of each point in its periphery from two fixed points, the foci, are equal. It is a conic section (see *conic*) formed by the intersection of a cone by a plane which cuts all the elements of the cone. The ellipse is a conic which does not extend to infinity, and whose intersections with the line at infinity are imaginary. Every ellipse has a center, which is a point such that it bisects every chord passing through it. Such chords are called *diameters of the ellipse.* A pair of conjugate diameters bisect, each of them, all chords parallel to the other. The longest diameter is called the *transverse* or *major axis,* also the *latus transversum*; it passes through the foci. The shortest diameter is called the *conjugate* or *minor axis.* The extremities of the transverse axis are called the *vertices.* (See *conic, eccentricity, angle.*) An ellipse may also be regarded as a flattened circle—that is, as a circle all the chords of which parallel to a given chord have been shortened in a fixed ratio by cutting off equal lengths from the two extremities. The two lines from the foci to any point of an ellipse make equal angles with the tangent at that point. To construct an ellipse, assume any line whatever, AB, to be what is called the latus rectum. At its extremity erect the perpendicular AD of any length, called the latus transversum (transverse axis). Connect BD, and complete the rectangle DABK. From any point L, on the line AD, erect the perpendicular LZ, cutting BK in Z and BD in H. Draw a line HG, completing the rectangle ALHG. There are now two points, E and E′, on the line LZ, such that the square on LE or LE′ is equal to the rectangle ALHG. The locus of all such points, found by taking L at different places on the line AD, forms an ellipse. [The name *ellipse* in its Greek form was given to the curve, which had been previously called the section of the acute-angled cone, by Apollonius of Perga, called by the Greeks "the great geometer." The participle ἐλλείπων, "falling short," had long been technically applied to a rectangle one of whose sides coincides with a part of a given line (see *Euclid,* VI. 27). So παραβάλλειν and ὑπερβάλλειν (*Euclid,* VI. 28, 29) were said of a rectangle whose side extends just as far and overlaps respectively the extremity of a given line. Apollonius first defined the conic sections by plane constructions, using the latus rectum and latus transversum (transverse axis), as above. The ellipse was so called by him because, since the point L lies between A and D, the rectangle ALHG "falls short" of the latus rectum AB. In the case of the hyperbola L lies either to the left of A or to the right of D, and the rectangle ALHG "overlaps" the latus rectum. In the case of the parabola there is no latus transversum, but the line BK extends to infinity, and the rectangle equal to the square of the ordinate has the latus rectum for one side.]—**Cubical ellipse.** See *cubical.*—**Focal ellipse.** See *focal.*—**Infinite ellipse.** Same as *elliptoid.*—**Logarithmic ellipse,** the section of an elliptic cylinder by a paraboloid. *Booth,* 1852.

★**elm** (elm), *n.* [< ME. *elm*, < AS. *elm* = Icel. *álmr* = Sw. *alm* = Dan. *ælm* (*alm*, *elm*, obs.) = D. *olm* = OHG. *elm*(*-boum*), afterward (simulating L. *ulmus*) MHG. *ulm*(*-boum*), G. *ulme* = L. *ulmus*, elm.] The common name for species of *Ulmus* (which see), mostly large trees, some common in cultivation for shade and ornament, for which the majestic height and the wide-spreading and gracefully curving branches of the principal kinds admirably adapt them. The hard, heavy timber of most of the species is valuable for many purposes. Of the European species, the common English elm is *U. campestris*, of which the cork-elm (*U. suberosa*), with thick plates of cork on the branches, is probably only a variety. The Scotch elm, or witch-elm, *U. montana*, is a smaller tree than the English elm. The American species are distinguished as the American elm, white elm, or water-elm, *U. Americana*; the cedar-elm of Texas, *U. crassifolia*; the cork-, cliff-, hickory-, swamp-, or rock-elm, *U. racemosa*; the red elm, slippery-elm, or moose-elm, *U. fulva*, the inner bark of which is mucilaginous, and is used in medicine; and the winged elm, or wahoo, *U. alata*, with corky-winged branches. In Australia the name is given to the *Aphananthe Philippinensis*, a species allied to the true elm. In the West Indies *Cordia Gerascanthus* and *C. gerascanthoides*, of the order *Boraginaceæ*, receive the name, as also the rubiaceous *Hamelia ventricosa*. The wood is the toughest of European woods, and is considered to bear the driving of bolts and nails better than any other. It is very durable under water, and is frequently used for keels of ships, for boat-building, and for many structures exposed to wet, or when great strength is required. Because of its toughness, it is used for naves of wheels, shells for tackle-blocks, and common turnery. Witch-elm is much used by coach-makers, and by ship-builders for making jolly-boats. Rock-elm is much used in boat-building, and to some extent for bows.

Flowering Branch and Foliage of English Elm (*Ulmus campestris*), with flower and fruit on larger scale.

The *elm* delights in a sound, sweet, and fertile land, something more inclin'd to moisture, and where good pasture is produced. *Evelyn*, Sylva, iv. § 6.

=**Syn.** 1. *Elocution*, *Delivery*. These words are quite independent of their derivation. *Elocution* has narrowed its meaning (see quotation from E. Porter, above), and has broadened it to take in gesture. They are now essentially the same, covering bodily carriage and gesture as well as the use of the voice. *Elocution* sometimes seems more manifestly a matter of art than *delivery*. See *oratory*.

Biblical critics are not agreed as to the reason for the use of the plural form: some regard it as a covert suggestion of the Trinity; others as a plural of excellence; others as an indication of an earlier polytheistic belief; still others as an embodiment of the Hebrew faith that the powers represented by the gods of the heathen were all included in one Divine Person.

It no longer seems worth while to write puerile essays to show that the *Elohist* was versed in all the conclusions of modern geology. *N. A. Rev.*, CXXVII. 334.

Elohistic (el-ọ-his′tik), *a.* [< *Elohist* + *-ic*.] A term applied to certain passages in the Pentateuch, in which God is always spoken of in the Hebrew text as Elohim, supposed by some to have been written at an earlier period than those passages in which he is spoken of as Jehovah. The Elohistic paragraphs are simpler, more pastoral, and more primitive in their character than the Jehovistic. Gen. i. 27 is Elohistic; Gen. ii. 21–24 is Jehovistic.

The New Testament authors followed the *Elohistic* account, and speak of him [Balaam] disparagingly. *Encyc. Brit.*, III. 259.

Cayley (1856) defines it as one of the coefficients of the quantic formed by substituting for x, y, etc., the facients of the quantic to which the emanant belongs, $lx + mx'$, $ly + my'$, etc., and then considering l and m as the two facients of the new quantic so obtained.

The doctrine of emanation appears in its noblest form in the Enneads of Plotinus, who makes sensible things to emanate from the Ideas, the Ideas to emanate from the Nous, and the Nous to emanate from the One. It sometimes happens that a cause causes the effect by its own existence, without any causality distinct from its existence; and this by some is called *emanative*: which word, though feigned with repugnancy to the analogy of the Latin tongue, yet is it to be used upon this occasion till a more convenient can be found out.

From *manceps* comes also *mancipium*, the formal act of purchase, hence a thing so purchased, and esp. a slave; but *emancipare* was not used in reference to freeing slaves, the word for this act being *manumittere*: see *manumit*.] 1. When the dying slaveholder asked for the last sacraments, his spiritual attendants regularly adjured him, as he loved his soul, to *emancipate* his brethren for whom Christ had died. *Macaulay.*

Was the *Emancipation Proclamation* legally operative and efficient the moment it was uttered? or, as many have maintained, only so fast and so far as our armies reached the slaves or the slaves our armies? *The Nation*, I. 163.

Gradual emancipation, the freeing of slaves by degrees or according to certain individual contingencies, as between specified ages or after a prescribed length of service. Slavery was extinguished by gradual emancipation in most of the original northern United States, and it was at an early date advocated by many in the more southern States. Laws were passed at different periods for gradual emancipation in the British and Spanish West Indies and in Brazil; but they have been in each instance finally superseded by acts for the absolute abolition of slavery.=**Syn. 1.** Release, manumission, enfranchisement.

(Swiss) *embritze, emmeritz*, equiv. to MHG. *amerinc, ämerinc*, G. *emmering, ämmering* (= MD. *emmerinck*), G. also *emmerling, ämmerling* (= MD. *emmerlinck*), a bunting, dim. of OHG. *amero*, MHG. *amer*, G. *ammer*, a bunting, = AS. *amore*, E. **ammer, hammer*, in *yellowhammer*: see *yellowhammer*.] A genus of buntings, conirostral passerine birds of the family *Fringillidæ*, such as the common corn-bunting of Europe (*E. miliaria*), the yellow bunting (*E. citrinella*), the cirl-bunting (*E. cirlus*), the ortolan (*E. hortulana*), etc. The limits of the genus are indefinite, and the term has no more exact meaning than *bunting* (which see). In a late restricted sense it includes more than 50 species, confined to the Palæarctic, Indian, and Ethiopian regions. None of the very many North and South American buntings which have been called *Emberiza* properly belong to this genus. See *Emberizinæ*, and cuts under *bunting* and *cirl-bunting*.

In such acceptation, the *Emberizinæ* include about 50 genera, of most parts of the world, represented by many of the most common buntings, finches, and 'sparrows' of English-speaking countries, especially of the United States, as the chip-, snow-, and vesper-bird, lark-finch, lark- and towhee-bunting, black-throated bunting, white-throated and white-crowned sparrows, field-, fox-, song-, swamp-, and savannah-sparrows, the longspurs, etc. See *Emberiza*.

The moisture causes the compressed portions forming the design to rise to their original height, and thus to project from the planed surface. Embossing on leather, paper, or cloth, as for book-covers, books for the blind, and various kinds of ornamental work, and also on metal, is usually effected by stamping with dies by means of an embossing- or stamping-press, or the bookbinders' arming-press. parent; a germ; a rudiment; in a more extended sense, a rudimentary animal during its whole antenatal existence. In the later stages of development, especially in man and the mammals generally, the name *fetus* commonly takes the place of *embryo*. In the cases of oviparous animals, the term *embryo* properly covers the whole course of development of the fecundated germ in the egg (which see, and see cut under *dorsal*): as, the hen's egg contained an *embryo* ready to hatch. By a late and loose, though now common, extension of the term, it is applied to various larval stages of some invertebrates, which in the course of their transformation are frequently so different from the parent as to be described as distinct species or genera: as, the *embryo* (first larval stage) of a cestoid worm.

2. In *bot.*, the rudimentary plant contained in the seed, the result of the action of pollen upon the ovule. It may be so rudimentary as to have apparently no distinction of parts; but even in its simplest form it consists virtually of a single internode of an axis, which upon germination develops at one extremity a leaf or leaves with a terminal bud, and a root at the other. In more developed embryos this initial internode or caulicle (also frequently called *radicle*) bears at one end one, two, or more rudimentary leaves called cotyledons, and often an initial bud or plumule. Also called *germ*. By recent authors the term is also applied to the developed oöspore in vascular cryptogams. See cuts under *albumen* and *cotyledon*.

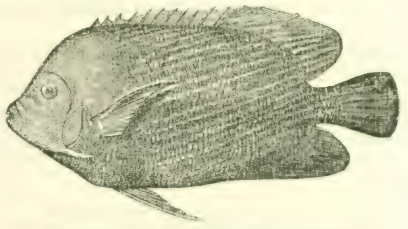
2. The sovereign or supreme ruler of an empire: a title of dignity conventionally superior to that of *king*: as, the *emperor* of Germany or of Russia. See *empire*. The title *emperor*, first assumed (with consent of the senate) by Julius Cæsar, was held by the succeeding rulers of the Roman, and afterward of the Western and Eastern empires. The line of emperors of the West terminated in A. D. 476, but the title was revived in 800 by Charlemagne, who thus laid the foundation of the elective Holy Roman Empire (which see, under *empire*). The last of his successors had, before his abdication in 1806, adopted the title of hereditary emperor of Austria. The king of Prussia was crowned emperor of Germany in 1871. Peter the Great of Russia assumed the title in 1721, and the ruler of Brazil in 1822; and it was held by Napoleon I. and Napoleon III. of France. In 1876 Queen Victoria of England was proclaimed empress of India. In western speech the sovereigns of Turkey, China, Japan, etc., are called emperors.



Under existing international arrangements the crowned heads of Europe take precedence according to the date of their accession, and their rank is precisely the same, whether their style is imperial or royal. But the proper meaning of *emperor* is the chief of a confederation of states of which kings are members.
Encyc. Brit., XXIII. 417.

emphasis (em′fā-sis), *n.* [= F. *emphase* (> D. G. *emphase* = Dan. *emfase* = Sw. *emfas*) = Sp. *énfasis* = Pg. *emphasis* = It. *enfasi*, emphasis, < L. *emphasis* (in pure L. *significatio(n-)*: see *signification*), < Gr. ἔμφασις, an appearing in, outward appearance, a showing or letting a thing be seen as in a mirror (reflection, image), or as involved, hence, in rhet., pregnant suggestion, indirect indication, significance, emphasis, < ἐμφαίνειν, show forth, < ἐν, in, + φαίνειν, show, mid. φαίνεσθαι, appear, > φάσις, phase, appearance: see *phase.*] 1. In *rhet.*: (*a*) Originally, a figure consisting in a significant, pregnant, or suggestive mode of expression, implying (especially in connection with the context or the circumstances under which an oration is delivered) more than would necessarily or ordinarily be meant by the words used. This figure is of two kinds, according as it suggests either something more than is said, or something purposely not mentioned or professedly not intended. Poets frequently employ it for the former purpose, especially in similes and epithets. (*b*) The mode of delivery appropriate to pregnant or suggestive expression; hence, rhetorical stress; in general, significant stress; special stress or force of voice given to the utterance of a word, succession of words, or part of a word, in order to excite special attention. Emphasis on a syllable differs from syllabic accent by being exceptional in use, and altering the ordinary pronunciation of the word, either by increasing the stress on the syllable regularly accented or by transferring the accent to another syllable: as, a sin may be a sin of o′mission or a sin of com′mission (instead of omis′sion, commis′sion).

The province of *emphasis* is so much more important than that of accent that the customary seat of the latter is transferred in any case where the claims of *emphasis* require it. *E. Porter*, Rhetorical Delivery, iv.

2. Special and significant vigor or force: as, *emphasis* of gesticulation; in general, significance; distinctiveness.

External objects stand before us . . . in all the life and *emphasis* of extension, figure and colour.

=**Syn.** 1. *Emphasis, Accent, Stress.* *Emphasis* is generally upon a word, but may be upon a combination of words or a single syllable. *Accent* is upon a syllable: as, the place of the *accent* in the word "demonstrate" is not fixed. *Stress* is a synonym for either *emphasis* or *accent*. See *inflection.*

That voice all modes of passion can express
Which marks the proper word with proper *stress;*
But none emphatic can that speaker call

It was usually for a perpetual term, thus corresponding to the feudal fee.

We are told that with the municipalities began the practice of letting out agri vectigales, that is, of leasing land for a perpetuity to a free tenant, at a fixed rent, and under certain conditions. The plan was afterwards extensively imitated by individual proprietors, and the tenant, whose relation to the owner had originally been determined by his contract, was subsequently recognised by the Prætor as having himself a qualified proprietorship, which in time became known as *Emphyteusis.*

2. The country, region, or union of states or territories under the jurisdiction and dominion of an emperor or other powerful sovereign or government; usually, a territory of greater extent than a kingdom, which may be, and often is, of small extent: as, the Roman or the Russian *empire*. The designation *empire* has been assumed in modern times by some small or homogeneous monarchies, generally ephemeral; but properly an empire is an aggregate of conquered, colonized, or confederated states, each with its own government subordinate or tributary to that of the empire as a whole. Such were and are all the great historical empires; and in this sense the name is applied appropriately to any large aggregation of separate territories under one monarch, whatever his title may be: as, the Assyrian, Babylonian, and Persian *empires;* the *empire* of Alexander the Great; the British *empire*, etc. See *emperor*, and *Holy Roman Empire*, below.

3. Supreme control; governing influence; rule; sway: as, the *empire* of reason or of truth.

Circle of the empire. See *circle*.—**Eastern Empire,** or **Empire of the East,** originally, that division of the Roman empire which had its seat in Constantinople. Its final separation from the Western Empire dates from the death of Theodosius the Great (A. D. 395), whose sons Arcadius and Honorius received respectively the eastern and western divisions of the Roman dominion. After the fall of the Western Empire, the Empire of the East is commonly known as the *Byzantine empire*. It continued until the capture of Constantinople by the Turks in 1453.—**Empire City,** the city of New York: so called as being the chief city of the Empire State, and the commercial metropolis of the United States.—**Empire State,** the State of New York: so called from its superior population and wealth as compared with the other States of the Union.—**Holy Roman Empire,** the German-Roman empire in western and central Europe (in later times commonly styled the *German empire*), which, after a lapse of more than three hundred years, reunited a large portion of the territories formerly belonging to the Western Empire. The union of the German royal and Roman imperial crowns began with Charles the Great or Charlemagne, king of the Franks, who was crowned emperor by the Pope at Rome A. D. 800; but the line of German kings who were at the same time Holy Roman emperors begins properly with Otho the Great, crowned emperor in 962. The empire was regarded as the temporal form of a theoretically universal dominion, whose spiritual head was the Pope and the earlier emperors were crowned at Rome by the spiritual rulers of Christendom. The empire continued under monarchs of the Saxon, Franconian, and Hohenstaufen dynasties, passing in 1273 to the Austrian house of Hapsburg, the members of which line remained in uninterrupted possession of the empire from 1438 until its final extinction in 1806. It had long previously lost the greater part of the external territories which had entitled it to be called Roman; and its final dissolution was due to the conquests and encroachments of Napoleon I. (See *emperor*.) The emperors were elected by certain of the more powerful German princes called electors, whose number was definitely fixed at seven by the Golden Bull of 1356, and remained at that number with but slight changes.—**The Celestial Empire.** See *celestial*.—**Western Empire,** the distinctive designation of the western portion of the Roman world after its division into two independent empires in A. D. 395. (See *Eastern Empire*, above.) Its power very rapidly declined under the inroads of barbarians and other adverse influences, and it was finally extinguished in A. D. 476. =**Syn. 1.** Sway, dominion, rule, reign, government, supremacy.

empiric (em-pir′ik), *a.* and *n.* [Formerly *empirick;* < OF. *empirique*, F. *empirique* = Sp. *empírico* = Pg. It. *empirico* (cf. D. G. *empirisch* = Dan. Sw. *empirisk*), < L. *empiricus*, < Gr. *ἐμπειρικός*, experienced (*οἱ Ἐμπειρικοί*, the Empirics: see II., 1), < *ἐμπειρία*, experience, mere experience or practice without knowledge, esp. in medicine, empiricism, < *ἔμπειρος*, experienced or practised in, < *ἐν*, in, + *πεῖρα*, a trial, experiment, attempt; akin to *πόρος*, a way, < **περ*, **παρ* = E. *fare*, go.] **I.** *a.* **1.** Same as *empirical*.—**2.** Versed in physical experimentation: as, an *empiric* alchemist.—**3.** Of or pertaining to the medical empirics.

It is accounted an error to commit a natural body to *empiric* physicians. *Bacon*, Advancement of Learning, i. 17.

II. *n.* **1.** [*cap.*] One of an ancient sect of Greek physicians who maintained that practice or experience, and not theory, is the foundation of the science of medicine.

Among the Greek physicians, those who founded their practice on experience called themselves *empirics;* those who relied on theory, methodists; and those who held a middle course, dogmatists.
Fleming, Vocab. of Philos. (ed. Krauth), p. 157.

2. An experimenter in medical practice, destitute of adequate knowledge; an irregular or unscientific physician; more distinctively, a quack or charlatan.

It is not safe for the Church of Christ when bishops learn what belongeth unto government, as *empirics* learn physic, by killing of the sick. *Hooker*, Eccles. Polity, vii. 24.

This is the cause why *empirics* and old women are more happy many times in their cures than learned physicians, because they are more religious in holding their medicines.
Bacon, Advancement of Learning, ii. 198.

There are many *empiricks* in the world who pretend to infallible methods of curing all patients.
Bp. Atterbury, Sermons, II. viii.

Empiricks and mountebanks.
Shaftesbury, Advice to an Author, ii. § 2.

3. In general, one who depends mainly upon experience or intuition; one whose procedure in any field of action or inquiry is too exclusively empirical.

The *empiric*, . . . instead of ascending from sense to intellect (the natural progress of all true learning), . . . hurries, on the contrary, into the midst of sense, where he wanders at random without any end, and is lost in a labyrinth of infinite particulars. *Harris*, Hermes, iv.

Vague generalisations may form the stock-in-trade of the political *empiric*, but he is an *empiric* notwithstanding. *Stubbs*, Medieval and Modern Hist., p. 91.

=**Syn. 2.** *Mountebank*, etc. See *quack*, *n.*

empirical (em-pir′i-kal), *a.* [< *empiric* + *-al*.] **1.** Pertaining to or derived from experience or experiments; depending upon or derived from the observation of phenomena.

In philosophical language the term *empirical* means simply what belongs to or is the product of experience or observation. *Sir W. Hamilton.*

Now here again we may observe the error into which Locke was led by confounding the cause of our ideas with their occasion. There can be no idea, he argues, prior to experience; granted. Therefore he concludes the mind previous to it is, as it were, a tabula rasa, owing every notion which it gains primarily to an *empirical* source.
J. D. Morell.

The *empirical* generalization that guides the farmer in his rotation of crops serves to bring his actions into concord with certain of the actions going on in plants and soil. *H. Spencer*, Prin. of Biol., § 28.

2. Derived, as a general proposition, from a narrow range of observation, without any warrant for its exactitude or for its wider validity.

The *empirical* diagram only represents the relative number and position of the parts, just as a careful observation shows them in the flower; but if the diagram also indicates the places where members are suppressed, . . . I call it a theoretical diagram.
Sachs, Botany (trans.), p. 525.

It is not at all impossible that Henry II. may have been among the pupils of Vacarius: certainly he was more of a lawyer than mere *empirical* education could make him.
Stubbs, Medieval and Modern Hist., p. 303.

3. Pertaining to the medical practice of an empiric, in either of the medical senses of that word; hence, charlatanical; quackish.

The *empirical* treatment he submitted to . . . hastened his end. *Goldsmith*, Bolingbroke.

Empirical certainty, cognition, ego, idealism, etc. See the nouns.—**Empirical formula** or **law,** a formula which sufficiently satisfies certain observations, but which is not supported by any established theory or probable hypothesis, so that it cannot be relied upon far beyond the conditions of the observations upon which it rests. Thus, the formula of Dulong and Petit expressing the relation between the temperature of a body and its radiative power cannot be extended to the calculation of the heat of the sun, since there is no reason for supposing that it would approximate to the truth so far beyond the temperatures at which the experiments were made.

empirically (em-pir′i-kal-i), *adv.* In an empirical manner; by experiment; according to experience; without science; in the manner of quacks.

Every science begins by accumulating observations, and presently generalizes these *empirically*.
H. Spencer, Data of Ethics, § 22.

empiricism (em-pir′i-sizm), *n.* [< *empiric* + *-ism*. See *empiric*.] **1.** The character of being empirical; reliance on direct experience and observation rather than on theory; empirical method; especially, an undue reliance upon mere individual experience.

He [Radcliffe] knew, it is true, that experience, the safest guide after the mind is prepared for her instructions by previous institution, is apt, without such preparation, to degenerate to a vulgar and presumptuous *empiricism*. *V. Knox*, Essays, xxxviii.

At present, he [Bacon] reflected, some were content to rest in *empiricism* and isolated facts; others ascended too hastily to first principles. *E. A. Abbott*, Bacon, p. 344.

What is called *empiricism* is the application of superficial truths, recognized in a loose, unsystematic way, to immediate and special needs.
L. F. Ward, Dynam. Sociol., II. 203.

2. In *med.*, the practice of empirics; hence, quackery; the pretension of an ignorant person to medical skill.

Shudder to destroy life, either by the naked knife or by the surer and safer medium of *empiricism*. *Dwight.*

3. The metaphysical theory that all ideas are derived from sensuous experience—that is, that there are no innate or a priori conceptions.

The terms *Empiricism*, Empiricist, Empirical, although commonly employed by metaphysicians with contempt to mark a mode of investigation which admits no higher source than experience (by them often unwarrantably restricted to Sensation), may be accepted without demur, since even the flavor of contempt only serves to emphasize the distinction.
G. H. Lewes, Probs. of Life and Mind, I. ii. § 14.

empiricist (em-pir′i-sist), *n.* [< *empiric* + *-ist*.] **1.** One who believes in philosophical empiricism; one who regards sensuous experience as the sole source of all ideas and knowledge.

Berkeley, as a consistent *empiricist*, saw that Sensation shuts itself up within its own home, and does not include its object. The object must be supplied from without, and he supplied it provisionally by the name of God.
N. A. Rev., CXX. 409.

The *empiricist* can take no cognizance of anything that transcends experience. *New Princeton Rev.*, II. 169.

It is to this sense [second muscular], mainly, that we owe the conception of force, the origin of which *empirism* could never otherwise explain.
G. S. Hall, German Culture, p. 219.

empiristic (em-pi-ris′tik), *a.* Of or pertaining to empiricism or to the empiricists; empirical. [Rare.]

The *empiristic* view which Helmholtz defends is that the space-determinations we perceive are in every case products of a process of unconscious inference.
W. James, Mind, XII. 545.

The *emplacements* should be connected with each other and with the barracks by screened roads.
Nature, XXXVI. 36.

(*b*) The platform or bed prepared for a gun and its carriage.

emplaster† (em-plās′tėr), *n.* [< ME. *emplastre*, < OF. *emplastre*, F. *emplâtre* = Pr. *emplastre* = Sp. *emplasto* = Pg. *emplastro* = It. *empiastro*, *impiastro*, < L. *emplastrum*, a plaster, also, in horticulture, the band of bark which surrounds the eye in ingrafting, the scutcheon, < Gr. *ἔμπλαστρον* (also *ἔμπλαστρος*) and *ἔμπλαστον*, with or without *φάρμακον*, a plaster or salve, neut. of *ἐμπλαστός*, daubed on or over, < *ἐμπλάσσειν*, plaster up, stuff in, < *ἐν*, in, + *πλάσσειν*, form, mold. (*b*) That kind of masonry, much used in ancient fortification-walls, etc., in which the outside surfaces on both sides are formed of ashlar laid in regular courses, and the inclosed space between them is filled in with rubble-work, cross-stones being usually placed at intervals, either in courses or as ties extending from face to face of the wall, and binding the whole together. The term is, however, a loose one, and can be applied to any sort of masonry of greater thickness than the width of a single block, and so laid that the wall is bound together by some regular alternation of blocks placed lengthwise and endwise. Sometimes erroneously written *emplection*.

To inclose; infold.—**2.** To give occupation to; make use of the time, attention, or labor of; keep busy or at work; use as an agent.

> The friends of liberty wasted . . . the time which ought to have been *employed* in preparing for vigorous national defense. *Macaulay*, Sir J. Mackintosh.

=**Syn. 2.** *Employ*, *Hire*. *Hire* and *employ* are words of different meaning. To *hire* is to engage in service for wages. The word does not imply dignity; it is not customary to speak of *hiring* a teacher or a pastor; we *hire* a man for wages; we *employ* him for wages or a salary. To *employ* is thus a word of wider signification. A man *hired* to labor is *employed*, but a man may be *employed* in a work who is not *hired*; yet the presumption is that the one *employing* pays. *Employ* expresses continuous occupation more often than *hire* does.

This liability is increased by the Workmen's Compensation Act (1897), which makes the employer liable to his employee for all accidents arising in the employment and not caused by the latter's negligence. Among the lower animals we see many symptoms of *emulation*, but in them its effects are perfectly insignificant when compared with those which it produces in human conduct. . . . In our own race *emulation* operates in an infinite variety of directions, and is one of the principal sources of human improvement.

My heart laments that virtue cannot live
Out of the teeth of *emulation*. *Shak.*, J. C., ii. 3.

=**Syn. 1** and **2**. *Emulation*, *Competition*, *Rivalry*. The natural love of superiority is known as *emulation;* in common use the word signifies the desire and the resulting endeavor to equal or surpass another or others in some quality, attainment, or achievement. It is intrinsically neutral both as to time and motive, but it is most frequently applied to the relations of contemporaries or associates, and to feelings and efforts of an honorable nature. *Competition* is the act of striving against others; the word is used only where the object to be attained is pretty clearly in mind, and that object is not mere superiority, but some definite thing: as, *competition* for a prize; *competition* in business. *Rivalry*, unless qualified by some favorable adjective, is generally a contest in which the competitors push their several interests in an ungenerous spirit, malignant feelings being easily a result. *Rivalry* may be general in its character: as, the *rivalry* between two states or cities; in such cases it may be friendly and honorable.

A noble *emulation* heats your breast. *Dryden.*

Envy, to which th' ignoble mind's a slave,
Is *emulation* in the learn'd or brave.

There are about 60 species, of numerous genera, agreeing in their hard shell, well-formed feet adapted both for walking and swimming, usually 5-toed before and 4-toed behind, and furnished with claws. They inhabit northern temperate and tropical regions, within which they are widely distributed.

A few occur in salt or brackish water. The leading genera are *Emys*, *Cistudo* (the box-tortoises), *Chelopus* (the speckled turtles), etc. The salt-water terrapin of the Atlantic States, *Malacoclemmys palustris*, well known to epicures, belongs to this family. By some the name is supplanted by *Clemmyidæ*, the genus *Emys* being referred to the family *Cistudinidæ*, and by others the family is considered to be inseparable from the *Testudinidæ*. en-¹. [ME. *en-*, < OF. *en-*, rarely F. *en-* = Sp. Pg. *en-* = It. *en-*, *in-*, < L. *in-* (see *in-*²), an adverbial or prepositional prefix, conveying the idea, according as the verb is one of rest or of motion, of existence 'in' a place or thing, or of motion, direction, or inclination 'into' or 'to' a place or thing, < *in*, prep., in, into, = E. *in:* see *in*¹. In later L. *in-* usually became *im-*, and so in Rom. *en-* usually becomes *em-*, before labials: see *em-*¹, *im-*².] A common adverbial or prepositional prefix, representing Latin *in-*, meaning primarily 'in' or 'into.' Appearing first in Middle English words derived through Old French from Latin, *en-*¹ (before labials *em-*) has come to be freely used as a prefix of words of native as well as of Romance or Latin origin, being equivalent to *in-*¹ of pure English origin and to *in-*² of direct Latin origin, and hence often restored to the pure Latin form. Hence forms in *en-*¹ (*em-*¹) and *in-*² (*im-*²) are frequently found (even in Middle English) coexisting, as *enclose*, *inclose*, *enquire*, *inquire*, *enwrap*, *inwrap*, *enfold*, *infold*, with, however, a tendency in one or other of the forms to disappear, or to become partly differentiated in use. Before labials *en-* becomes *em-*, as in *embellish*, *embrace*, but may remain unchanged before *m*, as in *enmew* or *emmew*. As a verbal prefix, *en-*, when joined to a noun, or a verb from a noun, may retain its original meaning of 'in' ('put in'), as in *encage* (put in a cage), *enfold*, *enfetter*, *encapsule*, etc.; or when prefixed to an adjective or a noun, it may denote a change from one state into another ('make . . . '), as in *enable* (make able), *enrich*, *enslave*, *enfranchise*, *enlarge*, and hence has often the effect simply of a verb-forming prefix. In some cases, prefixed to a verb, it has no additional force, as in *enkindle*, *encaptivate*.

en-². [F., etc., *en-*, < L. *en-*, < Gr. *ἐν-* (before gutturals *ἐγ-*), a prefix conveying with verbs the idea of 'in' or 'at' a place, etc., with adjectives the possession of a quality, 'having,' 'with,' 'in' (= L. *in-*, > *en-*¹, above), < *ἐν*, prep., = L. *in* = E. *in:* see *in*¹.] An adverbial or prepositional prefix of Greek origin, meaning primarily 'in': chiefly in scientific or technical words of modern formation, as in *encephalon*, *enanthema*, etc.

Like forms are found in the other Teut. tongues, being worn-down and assimilated forms of elements orig. of different origin.] A termination of various origin, used in the formation of verbs. (*a*) The infinitive suffix, now obsolete, as in Middle English *singen*, *escapen*, *pullen*, etc., modern English *sing*, *escape*, *pull*, etc. In late Middle English the *-n* fell away (*singe*, *escape*, *pulle*, etc.), but the *-e* continued to be pronounced, at least optionally, until near the end of the Middle English period; in modern English the *-e*, though always silent, is retained in spelling after a single consonant following a long vowel (as in *escape*) and in some other positions. (*b*) The suffix of the past participle of strong verbs (Middle English and Anglo-Saxon *-en*), as in *risen*, *written*, etc., past participles of *rise*, *write*, etc. In Middle English the *-n* often fell away (*risen* or *rise*, *writen* or *write*, etc.); hence in modern English many coexisting forms in *-en* and *-e* silent or absent, as *broken* and *broke*, *written* and *writ*, *beaten* and *beat*, *sunken* and *sunk*, etc. In most of these pairs there is a slight differentiation of use (as *sunken*, *drunken*, adj., *sunk*, *drunk*, pp.), or one form is obsolete (*writ*, pp., etc.) or regarded as "incorrect" (*broke*, *spoke*, etc.), or is merely vulgar (*riz* for *risen*, etc.). In some cases the past participle in *-en* is modern, the verb being originally weak (with past participle in *-ed*²), as in *worn*, pp. of *wear*. In most of such instances the older form in *-ed*² is still in prevalent use, as in *sewed* or *sewn*, *sawed* or *sawn*, *proved* or *proven*, etc., the *-ed*² being in some instances absorbed, as in *hid* or *hidden*, *chid* or *chidden*. (*c*) A suffix forming verbs from adjectives, as *weaken*, *fatten*, etc. Originally such verbs were only intransitive ('*become* weak, fat,' etc.), but now they are also transitive ('*make* weak, fat,' etc.). (*d*) In Middle English, a plural suffix of verbs: as, they *aren*, *weren*, *sayen*, *singen*, *sungen*, etc. It is now reduced to silent *-e* or entirely lost.

Special names are given to subdivisions of this figure. The substitution of one part of speech for another is *antimeria;* that of one case for another is *antiptosis*. Interchange of the functions of two cases in one phrase is a form of *hypallage*. Enallage of gender can hardly be illustrated in English. Antiptosis is exemplified in the colloquial "It's me" for "It is I." Enallage of number is seen in the royal and literary "we" for "I," and in our modern established "you" for "thou."

enamel (e-nam'el), *n.* [< ME. *enamaile* (with prefix *en-*, due to the verb *enamelen*), prop. **amaile, amel, amell, amelle, amall, aumayl*, later *ammell* (> D. G. *email* = Dan. *emaille* = Sw. *emalj*), < OF. *esmail*, F. *émail*, enamel: see *amel*.] 1. In *ceram.*, a vitrified substance, either transparent or opaque, applied as a coating to pottery and porcelain of many kinds. It is simply a fusible kind of glass, and when transparent is commonly called *glaze*. A vitreous coating of similar character is applied to a class of iron utensils for cooking, etc., and is made to serve other useful purposes.

2. In the *fine arts*, a vitreous substance or glass, opaque or transparent, and variously colored, applied as a coating on a surface of metal or of porcelain (see def. 1) for purposes of decoration. It consists of easily fusible salts, such as the silicates and borates of sodium, potassium, lead, etc., to which various earths and metallic oxids are added to give the desired colors. These enamels are now prepared in the form of sticks, like sealing-wax, and for use are pulverized, and applied to the surface either dry or moistened so as to form a paste. The object to be enameled is then exposed to a moderate temperature in a muffle, and the vitreous substance becomes sufficiently fluid to form a brilliant and adhesive coating. Enamels in modern times include an infinite number of tints; but those of the ancient Orientals and of the Byzantine empire present but few colors, and those distinctly contrasting. See def. 3, and *Limoges enamel*, below.

3. Enamel-work: a piece or sort of work whose chief decorative quality lies in the enamel itself: as, a fine piece of cloisonné *enamel;* a specimen of *enamel* à jour. Of this work there are three distinct classes: (1) *cloisonné enamel*, in which partitions surrounding the compartments of enamel of each different color are formed of wire of rectangular section secured to the body or foundation; (2) *champlevé enamel*, in which the surface of the background is engraved or hollowed out to receive the enamel; (3) *surface-enamel*, in which the whole surface of a plate of metal is covered with the enamel, which when fused affords a smooth ground for painting. A familiar instance of the last kind of enamel-work is the dial of a common watch, which is enameled on copper in white, the figures being painted upon it in black enamel. Champlevé enamel is most used for jewelry and similar decorative work.

About her necke a sort of faire rubies
In white floures of right fine *enamaile*.
The Assembly of Ladies, l. 534.

4. Any smooth, glossy surface resembling enamel, but produced by means of varnish or lacquer, or in some other way not involving vitrification: as, the *enamel* of enameled leather, paper, slate, etc.—5. In *anat.*, the hardest part of a tooth; the very dense, smooth, glistening substance which crowns a tooth or coats a part of its surface: distinguished from *dentin* and from *cement*. It is always superficial, and represents a special modification of epithelial substance. It is usually white, sometimes red, as in the front teeth of most rodents, or reddish-black, as in the teeth of most shrews. See cut under *tooth*.

All the bones of the body are covered with a periosteum, except the teeth; where it ceases, and an *enamel* of ivory, which saws and files will hardly touch, comes into its place. *Paley*, Nat. Theol., xi.

7. In *cosmetics*, a coating applied to the skin, giving the appearance of a beautiful complexion.—**Battersea enamel**, a kind of surface-enamel produced in Battersea, London, in the eighteenth century. The pieces of this enamel are usually decorated by a transfer process similar to that used for porcelain and English delft; they include needle-cases, étuis, and especially plaques with portraits.—**Canton enamel**, a variety of surface-enamel in which the ground is usually plain white, yellow, or light blue, and is decorated with enamel paintings in many colors, representing conventional flowers, scrolls, etc. Vases, incense-burners, etc., are made of it, and it is one of the most successful of modern Chinese artistic industries.—**Champlevé enamel**. See def. 3, and *champlevé*.—**Cloisonné enamel**. See def. 3, and *cloisonné*.—**Enamel à jour**, a kind of enamel in which there is no background, the enamel being made to fill all the space between the narrow bars or wires which form the design. Such enamel when translucent shows as a pattern seen by transmitted light.—**Enamel-columns**, the minute six-sided prisms of which the enamel of the teeth is composed. Also called *enamel-prisms, enamel-rods*, and *enamel-fibers*.—**Enamel-cuticle**, a thin horny cuticle covering the outer surface of the enamel in unworn teeth. Also called *Nasmyth's membrane* and *cuticula dentis*.—**Enamel en basse taille**, a variety of champlevé enamel in which the background of the lowered or sunken parts is sculptured with figures in relief, the enamel itself being transparent to allow them to be seen.—**Enamel en taille d'épargne**, a variety of champlevé enamel in which the field is almost wholly cut away or hollowed out for the reception of the enamel, leaving only narrow dividing lines of the metallic background.—**Flocked enamel**, enamel used for ornamenting a glass surface which has been made dull by grinding or by the use of acid.—**Glass enamel**, an opaque or semi-opaque glass having a milky appearance, due to the addition of binoxid of tin. It is used for window transparencies and "porcelain" lamp-shades.—**Incrusted enamel**, disks or similar small flat pieces of enameled metal inlaid in a larger surface, as of chased metal or filigree.—**Limoges enamel**, a variety of surface-enamel produced especially at Limoges in France, in which vessels and decorative pieces of various kinds and sizes are ornamented with pictorial subjects painted in many colors and in gold. This work reached its greatest excellence at the time of the Renaissance.

Encaustic painting. (*a*) The art of painting with wax as a vehicle: strictly applicable only to painting executed or finished by the agency of heat, but applied also to modern methods of painting in wax, in which the wax-colors are dissolved in a volatile oil and used in the ordinary way. In the hot process colored sticks of wax and resin are melted on a heated palette, applied with the brush, and afterward modeled and united with a heated iron and spatula. After the surface has become cool and hard, it is rubbed with a candle and gone over with a clean linen cloth. According to another method, tested by Count Caylus, the ground of cloth or wood is first rubbed over with a piece of beeswax, and afterward with chalk or whiting, in order to form a surface on which the colors will adhere. The colors are mixed simply with water, and are applied in the ordinary way. When the picture is dry, it is heated, and the wax softens and absorbs the colors, forming a firm and durable coating. Encaustic painting was in very common use among the ancient Greeks and Romans. Paintings executed in encaustic occupy, in color and general effect, a place midway between paintings in oil and in fresco. (*b*) In *ceram.*, an arbitrary name given by Josiah Wedgwood to his attempted imitation of the painted decoration of Greek vases, the effort being to produce fired colors without the gloss of enamel.—**Encaustic tile**, a tile for pavement- and wall-decoration, in which the pattern is inlaid or incrusted in clay of one color in a ground of clay of another color. The manufacture and employment of encaustic tiles were brought to great excellence in connection with the architecture of the twelfth and thirteenth centuries, particularly in France and England; and the art has been successfully revived in the nineteenth century. The name is an arbitrary one, without relation to the process of manufacture.—**Encaustic vase**, a vase painted with the so-called encaustic colors of Wedgwood ware. See *encaustic painting* (*b*).

★**endoderm** (en'dō-dėrm), *n.* [< Gr. *ἔνδον*, within, + *δέρμα*, skin.] In *zoöl.*, the completed inner layer of cells in all metazoan animals, formed by the cells of the hypoblast or endoblast, and representing, under whatever modification, the lining of the enteron: opposed to *ectoderm*. Primitively, it is the wall of the gastrular body-cavity, as the ectoderm is that of the whole body. Also *entoderm*. See cut under *Hydrozoa*.

The inner, or *endoderm*, is formed by the "invagination" of that layer into the space left void by the dissolution of the central cells of the "morula."
W. B. Carpenter, Micros., § 391.

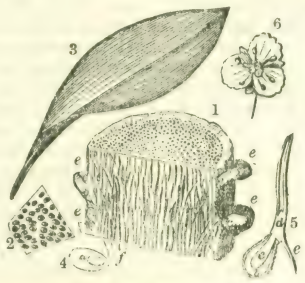
These [the Roman usus and confarreatio] are . . . forms appropriate to marriages between members of the same family-group or tribe; and . . . could only have originated among *endogamous* tribes.
McLennan, Prim. Marriage, iii.

The outer or *endogamous* limit, within which a man or woman must marry, has been mostly taken under the shelter of fashion or prejudice. It is but faintly traced in England, though not wholly obscured.
Maine, Early Law and Custom, p. 224.



★**endogamy** (en-dog'a-mi), *n.* [< Gr. *ἔνδον*, within, + *γάμος*, marriage.] Marriage within the tribe: a custom among some savage peoples: opposed to *exogamy*.

The rule which declares the union of persons of the same blood to be incest has been hitherto unnamed. . . . The words *endogamy* and exogamy (for which botanical science affords parallels) appear to be well suited to express the ideas which stand in need of names, and so we have ventured to use them.
McLennan, Prim. Marriage, iii., note.

Evidently *endogamy*, which at the outset must have characterized the more peaceful groups, and which has prevailed as societies have become less hostile, is a concomitant of the higher forms of the family.
H. Spencer, Prin. of Sociol., § 290.

endogastritis (en″dō-gas-trī'tis), *n.* [< Gr. *ἔνδον*, within, + *γαστήρ*, stomach, + *-itis*: see *gastritis*.] In *pathol.*, inflammation of the mucous membrane of the stomach; gastritis.

Cf. the like-formed Gr. *ἐνδογενής*, born in the house.] A plant that grows from within or has an endogenous structure, so named from the belief that the fibrovascular bundles were developed only about the center of the stem, in distinction from the *exogens* or "outside growers." The term was used in the plural by Lindley as the equivalent of the *Monocotyledones* (which see). In their structure the endogens differ from the exogens chiefly in the absence of a cambium layer and in the course of the vascular bundles, which, instead of being parallel to each other in successive concentric rings, have a variously oblique or curved direction, cross-

Parts of an Endogen.

ing each other, and forming a stem which has ordinarily no distinction of pith or bark, and in cross-section shows the bundles irregularly disposed, either scattered over the whole surface or gathered more compactly toward the circumference. The other organs of the plants are also characteristic. The leaves are generally parallel-veined, the flowers usually have three organs in each whorl, the seed has an embryo with one cotyledon, and the radicle issues from a sheath and is never developed into a taproot in germination. In view of the well-known fact that the living vascular cryptogams (*Bryophyta* and *Pteridophyta*) also have an endogenous structure (see *Endogenæ*), the term *endogens* has ceased to have any systematic value.

The structure of the roots of *endogens* and exogens is essentially the same in plan with that of their respective stems. *W. B. Carpenter*, Micros., § 375.

Endogenæ (en-doj'e-nē), *n. pl.* [NL., fem. pl. (sc. *plantæ*) of *endogenus*: see *endogenous*.] In *bot.*, A. P. de Candolle's name (1813) for the *Monocotyledones* (which see) and vascular ★cryptogams. Compare *Exogenæ*.

W. B. Carpenter, Micros., § 365.

The Protozoa are divisible into a lower and a higher group. . . . The floor of the thoracic cavity [of the crawfish] is seen to be divided into a number of incomplete cells, or chambers, by . . . apodemal partitions, which . . . arise partly from the intersternal, partly from the interepimeral mem-

brane connecting every pair of somites. The former portion of each apodeme is the endosternite, the latter the *endopleurite*. . . . The *endopleurite* . . . divides into three apophyses, one descending or arthrodial, and two which pass nearly horizontally inwards.

The epipodite may become a gill, etc. The endopodite becomes in the thoracic region an ambulatory limb, and is then the ordinary "leg" or "claw" of a crab or lobster. When thus fully developed, it consists of 7 joints. These are the coxopodite, basipodite, ischiopodite, meropodite, carpopodite, propodite, and dactylopodite, named from base to tip of the leg, in Milne-Edwards's and Huxley's nomenclature. The nippers or chelæ at the end of such a developed endopodite are the sixth and seventh of its joints, namely, the propodite and its movably apposable dactylopodite.

The axial endoskeleton consists of the entire series of vertebral and cranial segments, including ribs, breast-bones, hyoid bones, and jaws. The appendicular endoskeleton consists of the bones of the limbs, regarded as diverging appendages, and inclusive of the pectoral and pelvic arches (shoulder- and hip-girdles), by which these appendages are attached to the axial elements.

The phenomena differ from diffusion proper in being affected by the nature of the septum.—**Electrical endosmosis,** the cataphoric action of the electric current; the passage of an electrolyzed liquid through a diaphragm from the anode to the cathode. Some of the laws of the phenomenon have been made out, although it is not fully understood. The amount which passes is proportional to the intensity of the current and to the specific resistance of the liquid, and is independent of the area and thickness of the diaphragm. The hydrostatic pressure required to present the phenomenon is proportional to the thickness and inversely as the area of the diaphragm.

7. In *physics:* (*a*) Half the sum of the masses of the particles of a system each multiplied by the square of its velocity; half the vis viva. See *vis viva*. This sense, introduced by Dr. Thomas Young, is now obsolete. It gave rise to the following, which was introduced about 1850 by Sir William Thomson, and is now widely current. (*b*) Half the greatest value to which the sum of the masses of all the particles of a given system each multiplied by the square of its velocity, could attain except for friction, viscosity, and other forces dependent on the velocities of the particles; otherwise, the amount of work (see *work*) which a given system could perform were it not for resistance dependent on the velocities. The law of *energy* is precisely the principle that these two definitions are equivalent. This law applies solely to forces dependent alone on the relative positions of particles — that is, to attractions, repulsions, and their resultants. It is shown mathematically that, taking any two level or equipotential surfaces (see *equipotential*) which a particle might traverse in its motion, the difference of the squares of its velocities as it passed through them would be the same no matter from what point of space it started, nor what might be the direction and velocity of its initial motion. Thus, the square of the velocity at any instant could be deduced from that at any other by simply adding or subtracting a quantity dependent merely on the positions at these instants. In like manner, if a number of particles were moving about, subject to mutual attractions and repulsions, it is shown in dynamics that if to the sum of the masses, each multiplied by the square of its velocity, be added a certain quantity dependent only on the positions of the particles at that instant, this last sum would remain constant throughout the motion. Of these quantities, half the mass of a particle into the square of its velocity is termed its *actual energy*, or *energy of motion* — that is, its *kinetic activity;* while the quantity to be added to the sum of the actual energy in order to obtain a constant sum is termed the *potential energy* — that is, the latent or slumbering activity, or *energy of position;* the constant sum being termed the *total energy*. The corresponding general principle of physics is that the total energy of the physical universe is constant; this is the principle of the *persistence* or *conservation of energy*. (See below.) Examples of actual energy are the energy of sensible motion as in a moving cannon-ball, of sound-waves, of heat; of potential energy, the energy of position of a weight raised above the earth, of elasticity as in a bent bow, of electricity, chemical combination, etc. Potential or positional energy and actual or kinetic energy are in incessant interconversion; for positional energy implies force, or a tendency to motion, as much as kinetic energy implies motion or change of position. Thus, in the case of a swinging pendulum, the actual energy is null at the turning-points at the extremities of the swing, while the potential energy is at its minimum when the center of gravity is lowest; and the oscillation, but for resistances (as friction), would continue forever. Another equivalent version of the law of energy is as follows: Suppose a system of bodies were moving under the influence of those positional forces to which the law exclusively applies, and suppose that at any one instant all the particles were to strike squarely against elastic surfaces so as to have the directions of their motions reversed, but their velocities otherwise unaltered; then the whole series of motions would be performed backward, so that the particles would again pass through the same positions they had already passed through, and in the same intervals of time, but in the reverse order. Thus, a squarely rebounding cannon-ball in vacuo would move backward over the same trajectory, and with the same velocities, as in its forward motion, plunging into the mouth of the cannon again with exactly the velocity with which it had issued.

The heat which any ray, luminous or nonluminous, is competent to generate is the true measure of the *energy* of the ray.
Tyndall, Radiation, § 9.

The quantity of *energy* can always be expressed as that of a body of a definite mass moving with a definite velocity.
Clerk Maxwell, Matter and Motion, art. xcvii.

If we multiply half the momentum of every particle of a body by its velocity, and add all the results together, we shall get what is called the kinetic *energy* of the body.
W. K. Clifford, Lectures, II. 29.

Correlation of energies or **of forces**, the transformability of one form of energy into another. Thus, for example, when mechanical energy disappears, as in friction when a railroad-train is stopped at a station, or in percussion when a cannon-ball is arrested by a target, some other form of energy, chiefly heat, is produced in its place; moreover, there is a definite numerical relation existing between the energy expended and the heat which is produced as its equivalent. (See *equivalent.*) A water-wheel is an arrangement for transforming the energy of water into some other form of mechanical energy, as for sawing wood or grinding corn; a steam-engine is used to transform the potential chemical energy of coal or wood and oxygen of the air into mechanical energy, as in a mill; and in a voltaic battery the potential energy of the zinc and acid is transformed into the energy of an electric current, and this in turn may be transformed into light and heat, or mechanical motion, or chemical separation (as in electroplating). It is found, however, that in every transformation, while no energy is absolutely lost, a considerable portion is lost as useful or available energy, being transformed into useless heat; further, it can be shown that the process which is continually going on is a change from a higher type of energy to a lower, as from heat at a high temperature to heat at a lower — that is, a *degradation* or *dissipation of energy*. If the change were to go on until all bodies were at the same temperature, then no work of any kind would be possible. The principal *stores of energy* on the earth, available for the purposes necessary to human life and comfort, are: (*a*) the energy of coal, wood, oil, and other combustibles; (*b*) of water in motion, or in an elevated position; (*c*) of air in motion, as the wind; (*d*) the muscular energy of animals. To these might be added the energy of direct solar radiation, the energy of the tides, and some others of less importance. The source of all these forms of energy, except that of the tides, is to be found in the radiant energy of the sun. — **Energy of recoil**, the capacity for work which a body has upon a recoil, as a gun when fired. — **Energy of rotation** or **translation**, the capacity of a body for doing work in virtue of its motion of rotation or translation. See *motion*. — **Extensive energy**, the number of different coöperating powers which enter into a mental state. The phrase is also applied to a kind of elasticity. — **Radiant energy**, that form of energy which is emitted by a hot body and which is propagated by undulations in the luminiferous ether at a rate of about 186,000 miles per second, as the energy sent out by a stove, by the electric arc-light, or by the sun. Every body sends out radiant energy, whatever its temperature, but as its temperature rises the amount increases, and to the sum of rays before emitted are added others of shorter and shorter wave-length. When the temperature of a solid body is raised to about 600° C. it begins to be luminous. The first rays to affect the eye are those of the yellow-green of the spectrum, from which region visibility spreads with rising temperature into the portions of less luminosity at the ends of the spectrum. In the first color from a glowing body red predominates, passing into white as the shorter wave-lengths become relatively stronger, — hence the terms *red-hot*, *white-hot*. That portion of radiant energy which is incapable of affecting the eye is generally spoken of as *radiant heat*. See *heat*. — **The law of the conservation of energy**, the principle that the total energy of the universe is constant, no energy being created or destroyed in any of the processes of nature, every gain or loss in one form of energy corresponding precisely to a loss or gain in some other form or forms. (See *correlation of energies.*) This is the great fundamental principle of modern physics; it was perhaps first enunciated by K. F. Mohr in 1837, though several physicists were independently led to its discovery. Those uniformities of nature which present phenomena of irreversible actions — such as friction and other resistances, the conduction of heat and the phenomena of the second law of thermodynamics in general, chemical reactions, the growth and development of organic forms, etc. — cannot, according to this doctrine, result from the laws of force alone, but are to be accounted as statistical uniformities, due to vast numbers of fortuitously moving molecules. = **Syn. 2.** Activity, intensity, push, stir, zeal.

2. [ME. *English*, *Englisch*, etc., < AS. *Englisc*, *Ænglisc*, neut. adj. as noun (also with a noun, *Englisc gereord* or *getheód*), the English language — that is, the language spoken by the Angles and, by extension, by the Saxons and other Low German tribes who composed the people called Anglo-Saxons. See etymology above, *Anglo-Saxon*, and def.] The language of the people of England and of the peoples derived from them, including those of English descent in the United States of America, Canada, Australia, New Zealand, and the British dependencies in India, Africa, and other parts of the world. The signification of the term *English*, as applied to language, has varied with its changes of signification in political use. Originally applied to the language of the Angles, it came in time to be the general designation of the aggregate of slightly differing Low German dialects, Anglian and Saxon, which was recognized as the national tongue of the Teutonic invaders of Britain. This tongue, now generally known as *Anglo-Saxon* (see *Anglo-Saxon*), underwent in the course of time, by the Scandinavian invasion in the ninth century, and by the Norman conquest and the introduction of Norman French in the eleventh century, changes so extensive and profound as to make the "English" language of the later periods practically another tongue. Accordingly, the older stages of the language have at different periods received some special designation, as *Saxon*, *Anglo-Saxon*, *English-Saxon*, or *Saxon-English* for the language before the Norman conquest, and *Old English* or *Early English* for the period between the Norman conquest and the modern period. Recently some British scholars have insisted on using *English* to cover the whole range of the language, applying *Old English*, or, as some term it, *Oldest English*, to the Anglo-Saxon period. But, apart from the question as to the practical differences of the Anglo-Saxon and the language later called *English*, this tends to confusion, the term *Old English* having long had a distinct and well-understood application to the mixed language developed after the Norman conquest. Various divisions have been made of the periods of English. All are more or less arbitrary, there being no absolute gap even between the Anglo-Saxon and the following period. A common division, adopted in this dictionary, is as follows: (1) *Anglo-Saxon*, meaning usually and chiefly West-Saxon, but including all other Anglo-Saxon dialects, Kentish, Mercian, Old Northumbrian, etc., from the middle of the fifth century, or rather from the seventh century, when the first contemporary records (in Anglo-Saxon) begin, to the middle or end of the twelfth century (A. D. 450 (600)–1150 (1200)); (2) *Middle English*, also called *Old English*, from the middle or end of the twelfth century to the beginning of the sixteenth century (A. D. 1150 (1200)–1500); (3) *Modern English*, or simply *English*, from the beginning of the sixteenth century to the present time. Each of these periods is divided, when convenient, into three subperiods by the terms *early* and *late* applied to the first and the last part of the main periods. The periods of transition cannot be exactly fixed, and in the etymologies of this dictionary the designation "early Middle English," for example, with reference to a word or form, may coincide in date with the designation "late Anglo-Saxon," as applied to another word or form of earlier aspect or spelling. So "early modern English," referring properly to the first part of the sixteenth century (A. D. 1500–1550), may in some cases refer back to the last decades of the fifteenth century, or, in regard to archaic forms and spellings, may extend to the end of the sixteenth century. In particular cases the date of the century or the date of the year is given. Philologically, English, considered with reference to its original form, Anglo-Saxon, and to the grammatical features which it retains of Anglo-Saxon origin, is the most conspicuous member of the Low German group of the Teutonic family, the other Low German languages being Old Saxon, Old Friesic, Old Low German, and other extinct forms, and the modern Dutch, Flemish, Friesic, and Low German (Platt Deutsch). These, with High German, constitute the "West Germanic" branch, as Gothic and the Scandinavian tongues constitute the "East Germanic" branch, of the Teutonic family. (See the terms used.) By mixture with the Celtic and Latin of the Anglo-Saxon period, and later with the kindred Scandinavian, and then with the Old French of the Norman and other dialects, especially with the Norman French as developed in England (the Anglo-French), and with later French, and finally, in consequence of the spread of English exploration, commerce, conquest, and colonization, with nearly all the other great languages of the globe, English has become the most composite language spoken by man. The vocabulary of common life is still about three fourths of Anglo-Saxon origin; but the vocabulary of literature and commerce contains a majority of words of foreign origin, chiefly Latin or Greek, coming in great part through the Romance tongues, and of these chiefly through French. The languages from which the next greatest contributions have been received are the Scandinavian (Icelandic, Swedish, Danish, Norwegian), the Low German (Dutch, Flemish, etc.), Celtic, Hebrew, Persian, Arabic, Hindustani, Turkish, Malay, Chinese, American Indian, etc. The words derived from the more remote languages are, however, in great part names of products or customs peculiar to the countries concerned, and few of them enter into actual English use.

[U. S.]—**Pidgin English.** See *Pidgin-English.*—**Sandal-wood English.** See the extract.

★**engraving** (en-grā′ving), *n.* [Verbal n. of *engrave*[1], *v.*] 1. The act or art of cutting designs, inscriptions, etc., on any hard substance, as stone, metal, or wood. Many branches of the art, as gem-engraving, cameo-cutting, and die-sinking, are of great antiquity.

2. Specifically, the art of forming designs by cutting, corrosion by acids, a photographic process, etc., on the surface of metal plates or of blocks of wood, etc., for the purpose of taking off impressions or prints of the design so formed. Wood-engraving appears to have come first into use, the earliest dated wood-engraving, representing St. Christopher, bearing the date of 1423, while the earliest engraving worthy of the name from a metal plate was produced by Maso Finiguerra, a goldsmith of Florence, in 1452. Relief-engraving on wood was, however, in use among the Orientals at a far earlier period. In engraving on metal the lines or marks which are to appear on the paper are sunk into the plate, and before being printed from are filled with ink, the rest of the surface being cleaned before the impression is taken. On a block of wood the lines for impression are left prominent, the blank parts being cut away, so that the wooden block serves as a type. Copper and steel plates are printed from separately on a press specially adapted for this use; wooden blocks, on the ordinary printing-press, commonly along with the accompanying text. The wood generally used for fine engraving is box, and the metals commonly employed by engravers are copper and steel. Different methods or styles of engraving on steel or copper are known as *aquatint*, *etching*, *mezzotint*, *stipple*, *line-engraving*, etc.

In facsimile *engraving*, . . . the drawing is made upon the wood with a pen or the point of a brush, generally by another person, and all that the engraver does is just to hollow all the little areas of wood that are left inkless.
P. G. Hamerton, Graphic Arts, p. 413.

3. That which is engraved, or produced by engraving; an engraved representation, or an incised plate or block intended to be printed from: as, an *engraving* on a monument or a watch-case; a steel or a wood *engraving*.

With the work of an engraver in stone, like the *engravings* of a signet, shalt thou engrave the two stones with the name of the children of Israel. Ex. xxviii. 11.

4. An impression taken from an engraved plate or block; a print.—**Anaglyptographic engraving, anastatic engraving.** See the adjectives.—**Bureau of Engraving and Printing.** See *bureau.*—**Chalk engraving**, a form of stipple engraving used to imitate drawings made in chalk. The grain of the chalk drawing is reproduced by irregular dots of different forms and sizes.—**Copperplate engraving**, the art of engraving on prepared plates of copper for printing. To the plate is given a surface which is perfectly plane and highly polished. It is next heated sufficiently to melt wax, with which it is then rubbed over, so that when cooled it is covered with a white skin, to which the design or drawing is transferred. The engraver, with a steel point, follows the lines of the drawing, pressing lightly so as to penetrate through the wax and line faintly the copper surface beneath. The wax is then melted off, the surface cleaned, and the engraving is proceeded with, a burin or graver being used to cut the lines, a scraper to remove the slight bur raised by the burin, and a burnisher to soften or tone down the lines and remove scratches. The engraver uses also a woolen rubber and a little olive-oil to clean the face of the plate, in order to render the condition of his work plainly visible; and this rubber serves also to polish off the burs.—**Facsimile engraving**, engraving on wood, in which every line is either drawn on the block or else photographed from pen or pencil drawing in reduced size, the work of the engraver being to remove the wood from between these lines. This is the earliest method of wood-engraving, and is called *facsimile* in contradistinction to *tint engraving*, in which, the drawing being in wash, gauche, or oil paint, the engraver has to invent the lines, which he cuts in such a manner as to render when printed the exact shades of the original drawing—a method of engraving of comparatively recent origin.—**Line-engraving**, the art, methods, etc., of engraving in incised lines on metal. Modern line-engravers frequently begin by etching, and complete their work with the drypoint and the burin. After the design has been transferred to the etching-ground, and the parts to be bitten in, such as grass, foliage, sea-waves, and the flowing lines of draperies, have been drawn with the needle, all white objects, such as drapery, satin, clouds, ice, the light parts of water, etc., are stopped out, to preserve them from the corroding acid. A ruling-machine, consisting of a straight bar of steel with a sliding socket having a perpendicular tube containing a diamond-pointed pen attached to its side, is used to lay flat tints, such as clear-blue skies, in parallel lines, either straight or curved, as the shape of the object to be represented may demand. When the plate has been bitten in, the ground is removed and the unbitten parts are engraved with the burin. This instrument is handled in various ways, according to the texture of the object under treatment, as by cross-hatchings, undulating or straight lines, dots in lozenge-shaped or square spaces formed by the intersection of lines, etc.; care being taken to avoid sameness of stroke, and to give as much variety as possible to the necessarily more or less mechanical patterns produced by a stiff unyielding instrument.—**Photographic engraving**, any method of engraving in which an application of photography is a chief factor in the production of the block or plate from which the impressions are taken.—**Photo-intaglio engraving**, any process for producing lines on a plate by photography, and subsequently etching them in.—**Process engraving**, a name often given to photographic engraving. Also called *process.* (See also *etching*, *heliotypy*, *lithography*, *mezzotint*, *photo-engraving*, *photogravure*, etc.)

It is not the least of the recommendations of the new process of preserving green fodder, called *ensilage*, that the exclusion of oxygen is an essential feature in it, fire-risks being thus avoided.
W. L. Carpenter, Energy in Nature (1st ed.), p. 79.

One of the earliest of Latin writers refers to subterranean vaults (silos), wherein the ancient Romans preserved green forage, grain, and fruit, and the Mexicans have practised the system for centuries. 3. In *law:* (*a*) The limitation of land to certain members of a particular family or line of descent; a prescribed order of successive inheritances, voluntarily created, to keep land in the family undivided; the rule of descent settled for an estate.

He [Walpole] scoffed at . . . the practice of *entail*, and tasked the ingenuity of conveyancers to tie up his villa in the strictest settlement. *Macaulay*, Horace Walpole.

(*b*) An estate entailed or limited to particular heirs; an estate given to a man and his heirs. The word is now, however, often loosely used, since strict entails are obsolete, to indicate the giving of property to one or to two successively for life with suspension of power of alienation meanwhile. By early English law, as fully established under the Norman conquest, a feoffment or grant of land to "A and the heirs of his body" created an entail, so that neither A nor any successive heir taking under the grant could alien the land; and if the line of heirs failed, the land reverted to the lord who made the grant, or his heirs. In course of time the inconveniences of the restriction on alienation led the courts to hold that such a gift must be understood not as a gift to the heirs after A, but to A on condition that he should have heirs; in other words, that the heirs could not claim as donees under the feoffment, but only as heirs under A, and that hence A took a fee, which, if he had heirs of his body, became absolute, and enabled him to alien the land. This practical abolition of entails by the courts was followed by the statute of Westminster of 1285, known as the *statute de Donis Conditionalibus*, which enacted that the will of the donor in such gifts according to the form manifestly expressed should be observed, so that such a grantee should have no power to alien. Under this act, which reestablished entails, a large part of the land in England was fettered by such grants. The courts, still disfavoring entails, termed the estate thus granted a fee tail (see *tail*), and sustained alienations by the tenant in tail, subject, however, to the right of the heirs in tail, or, if none, of the lord, to enter on the death of the tenant who had conveyed. (See *base fee*, under *fee*[2].) They subsequently also sanctioned absolute alienations by allowing the tenant in tail to have an action brought against him in which he collusively suffered the plaintiff to recover the land. (See *fine*[2], *recovery*, and *Taltarum's case*, under *case*[1].) In 1833 a direct deed was substituted by statute for this fiction. The object of entails is now, to some extent, secured by family or marriage settlements, which are often, but inaccurately, spoken of as if effecting entails. In most if not all of the United States, and in Canada, entails have been abolished, either as in England or by statutes declaring that words which would formerly create an entail create a fee simple, or, as in some States, a life estate with remainder in fee simple to heirs.—**Quasi entail**, an entail of an estate less than a fee, such as an estate for the life of a third person.—**Statute of entail**, a name sometimes given to the statute de Donis Conditionalibus (which see, above).—**To bar an entail, to dock an entail**, to defeat the restrictions of an entail by aliening or resettling the land.

entelechy (en-tel'e-ki), *n.* [< L. *entelechia*, < Gr. ἐντελέχεια, actuality, < ἐν τέλει ἔχειν, be complete (cf. ἐντελής, complete, full): ἐν, in; τέλει, dat. of τέλος, end, completion; ἔχειν, have, hold, intr. be.] Realization: opposed to *power* or *potentiality*, and nearly the same as *energy* or *act* (actuality). The only difference is that *entelechy* implies a more perfect realization. The idea of entelechy is connected with that of form, the idea of power with that of matter. Thus, iron is potentially in its ore, which to be made iron must be worked; when this is done, the iron exists in *entelechy*. The development from being in posse or in germ to entelechy takes place, according to Aristotle, by means of a change, the imperfect action or energy, of which the perfected result is the entelechy. Entelechy is, however, either first or second. *First entelechy* is being in working order; *second entelechy* is being in action. The soul is said to be the first entelechy of the body, which seems to imply that it grows out of the body as its germ; but the idea more insisted upon is that man without the soul would be but a body, while the soul, once developed, is not lost when the man sleeps. Cudworth terms his plastic nature (which see, under *nature*) a first entelechy, and Leibnitz calls a monad an entelechy.

To express this aspect of the mental functions, Aristotle makes use of the word *entelechy*. The word is one which explains itself. Frequently, it is true, Aristotle fails to draw any strict line of demarcation between *entelechy* and energy; but in theory, at least, the two are definitely separated from each other, and ἐνέργεια represents merely a stage on the path toward ἐντελέχεια. *Entelechy* in short is the realization which contains the end of a process: the complete expression of some function — the perfection of some phenomenon, the last stage in that process from potentiality to reality which we have already noticed. Soul then is not only the realization of the body; it is its perfect realization or full development.

E. Wallace, Aristotle's Psychology, p. xlii.

At last a brewer hit upon a beverage which was considered to combine the flavors of these three, and which was called *entire*, as being drawn from one cask. As it was much drunk by porters and other working people, it also received the name of *porter*. In England, at present, the word *entire* is seldom heard or seen, except in connection with the name of some brewer or firm, as part of a sign or advertisement. See *porter*[3].]

When first thou gav'st the promise of a man,
When th' embrion spark of *entity* began. *Hart.*

2. An independent ens; a thing; a substance; an ontological chimera. As a concrete noun, it is chiefly used to express the current notion of the mode of being attributed by scholastic metaphysicians to general natures and to formalities. Modern writers have generally said the schoolmen made *entities* of words, a judgment which seems to espouse the nominalistic side of the great dispute, although the writers who use this phrase are not decided nominalists. Such being the connection which by its associations gives the word *entity* its meaning, the latter is necessarily vague.

The schools have of late much amused the world with a way they have got of referring all natural effects to certain *entities* that they call real qualities, and accordingly attribute to them a nature distinct from the modification of the matter they belong to, and in some cases separable from all matter whatsoever. . . . Aristotle usually calls substances simply *ὄντα, entities*.
Boyle, Origin of Forms (Works, 2d ed., III. 12, 16).

The realists maintained that general names are the names of general things. Besides individual things, they recognised another kind of things, not individual, which they technically called second substances, or universals a parte rei. Over and above all individual men and women there was an *entity* called Man—Man in general, which inhered in the individual men and women, and communicated to them its essence.
J. S. Mill, Exam. of Hamilton, xvii.

The scientific acceptance of laws and properties is quite as metaphysical as the scholastic acceptance of *entities* and quiddities; but the justification of the one set is their objective validity, i. e. their agreement with sensible experience; the illusoriness of the other is their incapability of being resolved into sensible concretes.
G. H. Lewes, Probs. of Life and Mind, I. i. § 62.

There is scarcely a less dignified *entity* than a patrician in a panic. *Disraeli.*

The foremost men of the age accept the ether not as a vague dream, but as a real *entity*.

It consists in the growth of a bud from the gastric cavity, into which it eventually passes on its way outward; while in all other cases gemmation takes place by the formation of a diverticulum of the whole wall of the gastrovascular cavity, which projects on the free surface of the body, and is detached thence (if it becomes detached) immediately into the circumjacent water. See *allœogenesis*.

The details of this process of *entogastric gemmation* have been traced by Haeckel in Carmarina hastata, one of the Geryonidæ. . . . What makes this process of asexual multiplication more remarkable is that it takes place in Carmarinæ which have already attained sexual maturity, and in males as well as in females.

It is restricted to a portion of the lower crustaceans, but the classifications vary so much that the term is gradually being abandoned. The groups usually noted by it are the *Ostracoda*, as *Cypris*; *Copepoda*, as *Cyclops*; *Cladocera*, as *Daphnia* (see *Daphnia*); *Branchiopoda*, as the brine-shrimp (*Artemia salina*) and the glacier-flea (*Podura nivalis*); *Trilobites*, all of which are extinct; *Merostomata*, of which *Eurypterus* and *Pterygotus* are the best-known examples among fossils, the king-crab being the only living example. To these some add the *Epizoa*, or parasitic crustaceans. No zoölogical definition can be framed to include all these groups, each of which is now usually regarded as a distinct order. The *Entomostraca* appear to have been first named by O. F. Müller in 1785, and have also been called *Gnathopoda*, as by H. Woodward. (*b*) In various systems, one of two main divisions of *Crustacea* proper (the other being *Malacostraca*). of a comet on the side next the sun and away from the tail, and appearing like a semicircular arch. Large comets generally show several of these under the telescope. They successively rise from the nucleus and disappear

5. In *geom.*, a curve or surface touching a continuous series of curves or surfaces. Thus, suppose a plane curve to undergo a continuous change in its shape and position; then the curve as it is at any instant is intersected by the curve as it is at any subsequent instant, and the closer the second instant follows after the first the closer do these intersections approach certain positions on the first curve. These positions are points on the envelop, and in this way all the points on the envelop are determined. If t is a variable parameter, and $P = 0$ is the equation of the surface, then the equation obtained by eliminating t between $P = 0$ and $dP/dt = 0$ is the equation to the envelop. Or if there are two variable parameters, s and t, the equation of the envelop is obtained by eliminating them between $P = 0$, $dP/ds = 0$, and $dP/dt = 0$. Every curve may thus be regarded as an envelop. Caustics, evolutes, etc., are so by their definitions.—**Floral envelop**, the perianth of a flower.—**Stamped envelop**, an envelop imprinted with a postage-stamp or other sign of value by government authority, and sold at a post-office for use in the mails at its face value, usually with a small addition to cover the cost of paper and manufacture.

It cuts the blanks from a continuous roll of paper, bends them into shape, and gums, folds, and presses the edges together. The machine then gums the edge of the flap, dries the gum, folds the flap, counts the finished envelops into bundles of twenty-five, delivers them, and records the total count. Sometimes the blanks are first cut to shape in a separate machine. The capacity of a good machine is estimated at 120 envelops a minute, or 72,000 in one day.

Conditions of environment, in *biol.*, the sum of the agencies and influences which affect an organism from without; the totality of the extrinsic conditioning to which an organism is subjected, as opposed to its own intrinsic forces, and therefore as modifying its inherent tendencies, and as a factor in determining the final result of organization. It is an expression much used in connection with modern theories of evolution in explaining that at a given moment a given organism is the resultant of both intrinsic and extrinsic forces, the latter being its *conditions of environment* and the former its inherited conditions. As the material for the growth and for the activity of a living being comes from its outer world, what was external is continually becoming internal, and part of its living substance; for the contrast between the living being and its environment is absolute.

The verb often expresses a much milder feeling than that which is usually denoted by the noun — one that may be consistent with perfect friendship and loyalty: as, I *envy* you your good health; I *envy* you your happy temper. But the feeling of envy is apt to beget repugnance and ill will, and some degree of these qualities is generally implied by the verb as well as by the noun.

In some words it is a false spelling of *-ious*, as in *calcareous* (Latin *calcarius*), *beauteous*, *duteous* (properly **beautious*, **dutious*); in *hideous* it is a substitute for *-ous*, and in *gorgeous* an accommodation of a different termination. In *righteous*, and the occasional *wrongeous*, *wrongous*, it is a perversion of the original *-wis*. See the words mentioned.

eozoic (ē-ō-zō′ik), *a.* [< Gr. *ἠώς*, dawn, + *ζωή*, life.] Of or pertaining to the oldest fossiliferous rocks, such as the Laurentian and Huronian of Canada, from the supposition that they contain the first or earliest traces of animal life.

Eozoön (ē-ō-zō′on), *n.* [NL., < Gr. *ἠώς*, dawn, + *ζῷον*, animal.] A name given in 1865 by Sir John William Dawson to a certain aggregate of minerals, which was regarded by him as a fossilized organic body, belonging to the *Foraminifera*. The best-characterized specimens of so-called *Eozoön* exhibit on the polished surface to the naked eye alternating bands of grayish and greenish color. These bands, which are generally from one to four tenths of an inch in thickness, vary considerably as regards the regularity of their occurrence, and between them are frequently seen layers of a mineral made up of fine parallel fibers. The whitish mineral is usually calcite; the greenish, serpentine; and the fibrous bands are the variety of serpentine called chrysotile. Microscopic examination has shown that the whole is an alteration-product of various minerals. The calcite has frequently running through it, and grouped in a great variety of ways, branching forms, which were supposed by the advocates of the foraminiferal nature of the *Eozoön* to represent the canal-system of that form of organisms. This same structure has, however, been frequently observed in minerals forming part of rocks of undoubted igneous origin, as well as in those occurring as veinstones, and there can no longer be any doubt as to the inorganic nature of the *Eozoön*. This supposed foraminifer, having been found in rocks called at that time Azoic, and later Archæan, was believed to be the oldest recognized organic form, and to represent the "dawn of life"; hence the generic name. The supposed species was called *E. canadense* by J. W. Dawson.

eozoönal (ē-ō-zō′ọn-ạl), *a.* [< *Eozoön* + *-al.*] Pertaining to or characterized by the supposed fossil called *Eozoön*: as, *eozoönal* structure.

The calcium and magnesium carbonates were very unequally distributed in the *eozoönal* limestones.

Eozoönina (ē-ō-zō-ō-nī′nạ), *n. pl.* [NL., < *Eozoön* + *-ina.*] A group of supposed foraminifers, represented by *Eozoön*, whose tests form irregular or acervuline adherent masses. Also *Eozoöninæ*, as a subfamily of *Nummulinidæ*.

Epacridaceæ (ep″ạ-kri-dā′sē-ē), *n. pl.* [< *Epacris* (*-id-*) + *-aceæ*.] A family of sympetalous plants, very closely allied to the *Ericaceæ*, but distinguished by one-celled, unappendaged anthers opening by a longitudinal slit. There are about 25 genera and over 300 species, natives of Australasia, the Pacific islands, etc., with a single species in Patagonia and Tierra del Fuego. The largest genus is *Styphelia*, some species of which bear edible berries. The family contains many very ornamental species, sparingly represented in greenhouses.

Epacris (ep′ạ-kris), *n.* [NL., so called in allusion to the terminal spikes of the flowers (cf. Gr. *ἐπάκριος*, on the heights), < Gr. *ἐπ-* + *ἄκρος*, pointed at the end: see *acro-*.] The typical genus of the family *Epacridaceæ*, of 30 shrubby, heath-like species, mostly Australian. From the abundance and beauty of their flowers, which are generally in leafy spikes, several species have been favorites in cultivation.

Flowering Branch of *Epacris impressa*, with flower on larger scale.

epact (ē′pakt), *n.* [< OF. *epacte*, F. *épacte* = Sp. Pg. It. *epacta*, < LL. *epacta*, always in pl. *epactæ*, < Gr. *ἐπακτή*, the epact, pl. *ἐπακταί* (sc. *ἡμέραι*), intercalary days, fem. of *ἐπακτός*, brought in, intercalated, adscititious, < *ἐπάγειν*, bring in or to, add, intercalate, < *ἐπί*, to, + *ἄγειν* = L. *agere*, bring, lead: see *act*, etc.] **1.** The excess of a solar over a lunar year or month. Hence, usually—**2.** A number attached to a year by a rule of the calendar to show the age, in days completed and commenced, of the calendar moon at the beginning of the year—that is, on January 1st in the Gregorian, Victorian, and early Latin calendars, or March 22d in the Dionysian calendar, or old style. A rule for the epact has been attached to every calendar of the Western churches, except the German Evangelical calendar of A. D. 1700–1779. The epact usually increases by 11 from one year to the next, 30 being subtracted from the sum when the latter exceeds 30 (a circumstance which indicates 13 new moons in the year); but in some years the increase is 12 instead of 11, and this is called a leap of the moon. In the Gregorian calendar the increase is sometimes only 10. In the earliest calendars the leaps of the moon took place every 12 years, and later every 14; but since the adoption of the Victorian calendar in the fifth century, they have taken place every 19 years. To find the epact in old style, divide the number of the year by 19, take 11 times the remainder after division, divide the product by 30, and the remainder after this division is the epact. When there is no remainder, some chronologers make the epact 29, but 30 is preferable. This epact shows the age of the calendar moon on March 22d, by means of which the age on every other day can be calculated, by allowing alternately 29 and 30 days to a lunation. This would also agree with the age of the mean moon were the calendar perfect. The intercalary day of leap-year necessarily removes the calendar moon one day from the mean moon in certain years; and the error of the 19-year period accumulates to one day every 310 years, so that to approximate more closely to the age of the moon the epact should be increased by 2 for every 300 years from the middle of the fifth century. It should also be increased by 1 for leap-years and years following leap-year. The Gregorian epact exceeds the Dionysian by 1 in the sixteenth and seventeenth centuries, agrees with it in the eighteenth and nineteenth centuries (but instead of 30 an asterisk, *, is written), and falls short of it by 1 in the twentieth and twenty-first centuries. This irregularity is because the Gregorian epact receives a solar correction, being a deduction of 1, at the advent of every century-year not a leap-year, and a lunar correction, being an addition of 1, every 300 years beginning with A. D. 1800 until seven such corrections have been applied, when 400 years elapse before a new series of seven corrections commences. This is called the *cycle* or *period of epacts*. The Gregorian epact shows the age of the calendar moon on January 1st. This will rarely differ by more than one day from the real moon.—**Annual epact,** the excess of the Julian solar over the lunar year of 12 lunations, being 10.9 days.—**Astronomical epact,** the epact in sense 1.—**Embolismic epact,** an epact exceeding 18, so that that of the following year will be less or *.—**Epact of a day,** the age of the calendar moon on that day.—**Gregorian epact,** the epact of the Gregorian calendar.—**Julian epact,** a number showing the age of the Gregorian calendar moon on January 1st in the old style.—**Menstrual epact,** the excess of a civil calendar month over a synodical month, or the amount by which the moon is older at the end than at the beginning of the calendar month.

Extended or strict induction is not feasible in oratory, as it would weary instead of convincing. See *example* and *paradigm*.

An example of epanalepsis is found in 1 Cor. xi.: "(v. 18) When ye come together in the church, I hear that there be divisions among you. . . . (v. 20) When ye come together therefore into one place, this is not to eat the Lord's supper."

epanaphora (ep-a-naf′ō-rạ), *n.* [L., < Gr. *ἐπαναφορά*, a reference, repetition, < *ἐπαναφέρειν*, bring back again, refer, < *ἐπί* + *ἀναφέρειν*, bring back: see *anaphora*.] In *rhet.*, a figure by which the same word or group of words is repeated at the beginning of two or more clauses, sentences, or verses in immediate succession or in the same passage. This figure is very frequent in the Book of Psalms; as, for example, in the twenty-ninth Psalm, the phrase "Give unto the Lord" is used three times in the first two verses, and the phrase "The voice of the Lord" occurs seven times in verses 3–9. Similarly, the words "by faith" or "through faith" (both renderings representing the one Greek word, *πίστει*) begin eighteen out of twenty-nine verses in Heb. xi. The name *epanaphora* is retained when synonyms or words of similar meaning are substituted for the word or words to be repeated: as, "*Praise* the Lord, all ye Gentiles; and *laud* him, all ye people," Rom. xv. 11. The converse of epanaphora is *epiphora*. Also called *anaphora*, and sometimes *epibole*.

Upon being admitted to take the sacred oath he received some of the citizen's privileges, and he became a full citizen after completing with honor his two years as an ephebe. 3. A May-fly, day-fly, or shad-fly; an ephemerid. See *Ephemeridæ* and *May-fly*.

The *Ephemera*, weak as it is individually, maintains itself in the world by its prolificacy. Brooks and ponds are richly populated with their young, and through the summer, when they come to maturity and take their flight, these delicate beings appear in immense numbers. They rise from the waters of our great inland lakes, fall a rapid prey to the waves, and are washed ashore in enormous quantities, their dead bodies forming windrows, comparable in extent with the sea-wrack of oceanic shores. They settle down in clouds in the streets of the lake cities, obscuring the street-lamps, and astonishing the passer-by. *Stand. Nat. Hist.*, II. 152.

The head is small and rounded, with large eyes meeting on top, and minute subulate 3-jointed antennæ; the mouth-parts are wanting or are very rudimentary; the thorax is globose, with a small collar-like prothorax; the abdomen is elongate and slender, terminated by 2 or 3 long, slender filaments; and the wings are closely net-veined, the hinder pair much smaller than the fore, or wanting. Though so fragile and fugacious in the imago, these insects in the larval and pupal states are long-lived, existing many months or for two or three years, have well-developed jaws, and are predaceous; they live in the water, and are notable for molts or castings of the skin, sometimes to the number of 20; they are well known to anglers as bait. There are about 12 leading genera, and individuals of various species swarm in prodigious numbers. In Christian times Ephesus became noted as a center of St. Paul's work in Asia Minor (one of his epistles also being inscribed "to the Ephesians"), as one of the seven churches of the Apocalypse, and as the residence and death-place of St. John, after whom a modern village on the site is called *Aiasuluk* (that is, "Ἅγιος Θεόλογος, the Holy Divine). It had the title of apostolic see, and its metropolitan had a rank nearly equal to that of patriarch, till overshadowed by the rise of the patriarchate of Constantinople. It was also the scene of a number of ecclesiastical councils, one of them ecumenical. Also *Ephesine.*—**Ephesian Artemis.** See *Diana.*—**Ephesian** or **Ephesine Council**, any one of the several church councils held at Ephesus, the earliest of which met in A. D. 431, under the emperors Theodosius II. and Valentinian III., the most prominent member of which was St. Cyril, patriarch of Alexandria. It deposed Nestorius, patriarch of Constantinople, and condemned his teaching as to the person of Christ. (See *Nestorianism.*) It also decreed that no bishop should subject to himself any ecclesiastical province which had not from the beginning been under the authority of his predecessors, and that any province so subjected should be restored, and the original rights of each province always remain inviolate.—**Ephesian** or **Ephesine Latrocinium**, a Eutychian council which met at Ephesus A. D. 449. It claimed to be ecumenical, but all its acts were annulled at the Chalcedonian council, A. D. 451. When the next moult takes place, these altered portions of the integument, constituting the *ephippium*, are cast off, together with the rest of the carapace, which soon disappears, and then the *ephippium* is left, as a sort of double-walled spring box (the spring being formed by the original dorsal junction of the two halves of the carapace) in which the ephippial ova are enclosed. Doddridge, Epigram on his Family Arms.

=**Syn. 2.** *Epicure, Gourmet,* and *Gormand* agree in representing one who cares a great deal for the pleasures of the table. Shak., A. and C., ii. 1.

II. *n.* 1. A follower of Epicurus, the great sensualistic philosopher of antiquity (341–270 B. C.), who founded a school at Athens about 307 B. C. He held, like Bentham, that pleasure is the

only possible end of rational action, and that the ultimate pleasure is freedom from disturbance. In logic the Epicureans are distinguished from all the other ancient schools, not only in maintaining an experiential theory of cognition and the validity of inductive reasoning, but also in denying the value of definitions, syllogism, and the other apparatus of the a priori method. Like J. S. Mill, they based induction upon the uniformity of nature. Epicurus was very strenuous in the advocacy of natural causes for all phenomena, and in resisting hypotheses of the interference of supernatural beings in nature. He adopted the atomistic theory of Democritus, while bringing into it the doctrine of chance, which is the very life of that theory. His views were thus more like those of a modern scientist than were those of any other philosopher of antiquity. Owing, however, to the natural repugnance to doctrines seeming to lower the nature of man, Epicurus and his school have been much hated and abused; so that *an Epicurean* has come to mean also a mere votary of pleasure. See 2.

I know it, and smile a hard-set smile, like a stoic, or like
A wiser *epicurean*, and let the world have its way.
Tennyson, Maud, iv. 4.

2. [*cap.* or *l. c.*] A votary of pleasure, or one who pursues the pleasures of sense as the chief good; one who is fond of good living; a person of luxurious tastes, especially in eating and drinking; a gourmet; an epicure.

The brotherhood
Of soft *Epicureans* taught — if they
The ends of being would secure, and win
The crown of wisdom — to yield up their souls
To a voluptuous unconcern.
Wordsworth, Excursion, iii.

Epicureanism had indeed spread widely in the empire, but it proved little more than a principle of disintegration or an apology for vice, or at best the religion of tranquil and indifferent natures animated by no strong moral enthusiasm. *Lecky*, Europ. Morals, I. 184.

2. [*l. c.*] Attachment to or indulgence in luxurious habits; fondness for good living. See *epicure*, *n.*, 2.

See *epicyclic train*, under *epicyclic.*—**2.** In the Ptolemaic system of astronomy, a little circle, conceived for the explanation of planetary motion, whose center was supposed to move round in the circumference of a greater circle; a small circle whose center, being fixed in the deferent of a planet, was supposed to be carried along with the deferent, and yet by its own peculiar motion to carry the body of the planet fastened to it round its proper center. Copernicus also made use of epicycles, which, however, were banished by Kepler.

The moone moevyth the contrarie from othere planetes as in hire *episicle*, but in non other manere.
Chaucer, Astrolabe, ii. § 35.

It is used for converting circular into alternate motion, or alternate into circular. While the revolution of the smaller wheel is taking place, any point whatever on its circumference will describe a straight line, or will pass and repass through a diameter of the circle, once during each revolution. In practice a piston-rod or other reciprocating part may be attached to any point on the circumference of the smaller wheel.

epigenesis (ep-i-jen′e-sis), *n.* [< Gr. *ἐπί,* upon, in addition, + *γένεσις,* generation: see *genesis.*] **1.** The coming into being in the act or process of generation or reproduction; the theory or doctrine of generation in which the germ is held to be actually procreated by the parents, not simply expanded or unfolded or made to grow out of an ovum or spermatozoön in which it preëxisted or had been preformed. Thus, in its application to plants, this theory maintains that the embryo does not preëxist in either the ovary or the pollen, but is generated by the union of the fecundating principles of the male and female organs. In zoölogy the doctrine supplanted the theory of incasement (see *incasement*), as held by both the animalculists and the ovulists, and may be considered to have itself "incased" the germ of all modern doctrines of ontogenetic biogeny, or evolution of the individual from preëxisting individuals. The theory was promulgated in substance in 1759 by C. F. Wolff, and in a modified form, as above, is the doctrine now accepted.

More correctly, perhaps, *epigenesis* is an event of evolution, and evolution impossible without *epigenesis;* for evolution, strictly speaking, is the unfolding of that which lies as a preformation in germ, which a new product with new properties manifestly does not, any more than the differential calculus lies in a primeval atom; while *epigenesis* signifies a state that is the basis of, and the causative impulse to, a new and more complex state. *Maudsley,* Body and Will, p. 170.

A valve-like organ which helps to prevent the entrance of food and drink into the larynx during deglutition. In man the epiglottis is of oblong figure, broad and round above, attached by its narrow base to the anterior angle of the upper border of the thyroid cartilage or Adam's-apple, and also to the hyoid or tongue-bone, and the tongue itself; its ligaments for these attachments are the thyro-epiglottic, hyo-epiglottic, and glosso-epiglottic, the latter three in number, forming folds of mucous membrane. The muscles of the epiglottis are three, the thyro-epiglottideus and the superior and inferior aryteno-epiglottideus. Its substance is elastic yellow fibrocartilage, covered with mucous membrane continuous with that of the fauces and air-passages. In its ordinary state, as during respiration, the epiglottis stands upon end, uncovering the opening of the larynx; during the act of deglutition it is brought backward so as to protect this orifice. Any similar structure in the lower animals receives the same name. See cuts under *alimentary* and *mouth*.

In *entom.*, same as *epipharynx*.—**Cushion** or **tubercle of the epiglottis,** a rounded elevation, covered with mucous membrane of a bright-pink color, in the middle line below the base of the epiglottis and above the rima glottidis. *Quain; Holden.*—**Depressor epiglottidis,** the depressor of the epiglottis, a part of the thyro-epiglottidean muscle continued on to the margin of the epiglottis.—**Frenum epiglottidis** (bridle of the epiglottis), one of the three folds of mucous membrane, or glosso-epiglottic ligaments, which pass between the epiglottis and the tongue.

Ch.*, one of the episcopal vestments, consisting of a piece of brocade or some other stiff material shaped like a rhomb or lozenge, and worn on the right side at or below the knee, hanging by one of its angles from the zone or girdle. The other three angles have tassels attached to them, and it is embroidered with a cross or other ornamentation. As late as the eighth century, and in some places as late as the eleventh, a handkerchief or napkin (the *encheirion*, which see) was worn in a similar manner, as it still is in the Armenian Church, and the epigonation is probably a more modern form of this. Accordingly, some writers connect this vestment with the towel (λέντιον) with which Christ girded himself before washing the disciples' feet. John xiii. 5.

Attached to the . . . [zone], on the right side, the Bishop wears an ornament . . . termed the *epigonation;* it is . . . made of brocade, or some other stiff material, a tassel being attached to the lower corners. This was at first, like the Latin maniple, a mere handkerchief.

Sw. *epigram*, < L. *epigramma*, < Gr. ἐπίγραμμα(τ-), an inscription, an epigram, an epitaph, < ἐπιγράφειν, inscribe: see *epigraph*.] 1. In *Gr. lit.*, a poetical inscription placed upon a tomb or public monument, as upon the face of a temple or public arch. The term was afterward extended to any little piece of verse expressing with precision a delicate or ingenious thought, as the pieces in the Greek Anthology. In Roman classical poetry the term was somewhat indiscriminately used to designate a short piece in verse; but the works of Catullus, and especially the epigrams of Martial, contain a great number with the modern epigrammatic character.

This *Epigramme* is but an inscription or writting made as it were vpon a table, or in a windowe, or vpon the wall or mantell of a chimney in some place of common resort.
Puttenham, Arte of Eng. Poesie, p. 43.

Probably the first application of the newly adapted art [engraving words on stone or metal] was in dedicatory inscriptions or *epigrams*, to use this word in its original sense.
C. T. Newton, Art and Archæol., p. 100.

Hence—2. In a restricted sense, a short poem or piece in verse, which has only one subject, and finishes by a witty or ingenious turn of thought; hence, in a general sense, an interesting thought represented happily in a few words, whether verse or prose; a pointed or antithetical saying.

The qualities rare in a bee that we meet
In an *epigram* never should fail;
The body should always be little and sweet,
And a sting should be left in its tail.
Trans. from Latin (author unknown).

From the time of Martial, indeed, the *epigram* came to be characterized generally by that peculiar point or sting which is now looked for in a French or English *epigram;* and the want of this in the old Greek compositions doubtless led some minds to think them tame and tasteless. The true or the best form of the early Greek epigram does not aim at wit or seek to produce surprise.
Lord Neaves.

On comparing these three great orders of feelings, we found that whereas the *epiperipheral* are relational to a very great extent, the entoperipheral, and still more the central, have but small aptitudes for entering into relations. *H. Spencer.*

epipetalous (ep-i-pet′a-lus), *a.* [< NL. *epipetalus,* < Gr. *ἐπί*, upon, + *πέταλον*, leaf (mod. petal): see *petal.*] Borne upon or placed before the petals or corolla of a flower: applied to stamens.

C. Elton, Origins of Eng. Hist., p. 90.

2. Among the ancient Greeks, a festival held in commemoration of the appearance of a god in any particular place.—**3.** [*cap.*] A Christian festival, closing the series of Christmas observances, celebrated on the 6th of January, the twelfth day after Christmas (hence called Twelfth-day), in commemoration of the manifestations of Christ to the world as the Son of God, in the West especially that to the Gentiles through the visit of the Magi in his infancy. It was early instituted in the East in celebration both of his nativity and of his baptism, the former being afterward transferred to the 25th of December. In the West it has been observed since the fourth century with special reference to the visit of the Magi or the three kings, with which are combined in the Roman Catholic Church his baptism and his first miracle at Cana of Galilee.

Therefore, though the church do now call Twelfth-day *Epiphany*, because upon that day Christ was manifested to the Gentiles in those wise men who came then to worship him, yet the ancient church called this day [the day of Christ's birth] the *Epiphany*, because this day Christ was manifested to the world, by being born this day.

An *epiphysis* is properly distinguished from an *apophysis*, or mere bony process or outgrowth without independent ossific center, being always autogenous or endogenous, and not merely exogenous; but the distinction is not always observed, especially as a completed and coössified epiphysis cannot be recognized as such with certainty. The term is used by De Bary to denote any plant, whether parasitic or not, growing on the surface of another plant, as distinguished from *entophyte.* **2.** In *zoöl.*, a fungus parasitic on the skin and its appendages or on mucous surfaces of man and other animals, causing disease; a dermatophyte. *Thomas*, Med. These splints are either articulated or ankylosed with their respective ribs, and have independent centers of ossification. They do not occur on the posterior or sacral ribs, and are found only upon the pleurapophysial part of any rib. Also *epipleural*.

3. In *entom.*, the outer side of a beetle's wing-cover when it is inflexed or turned down so as to cover partially the side of the thorax and abdomen. Also called the *side-cover*. See *omentum*.

episcopacy (ē-pis′kō-pạ-si), *n.* [As *episcopate*[2] + *-acy*.] 1. Government of the church by bishops; that form of church government in which there are three distinct orders of ministers—bishops, priests or presbyters, and deacons. In episcopacy the order of bishops is superior to the other clergy, and has exclusive power to confer orders. Episcopacy is the organic system since early times of all the Oriental churches (Greek, Armenian, Coptic, etc.) and of the Roman Catholic Church, and also of the Anglican Church and its various branches. These churches teach that it is of apostolic origin and essential to the maintenance of valid orders. Government by bishops was continued in the Scandinavian churches (called *Lutheran*) in Denmark and Sweden, in the latter country apparently without interruption at the Reformation. The Moravian Church also claims an uninterrupted succession. The bishops of the Moravian and American Methodist Episcopal churches are itinerant, and have no special diocesan jurisdiction. The Mormons also have an officer called bishop. Maintainers of episcopacy hold that (whether the word *bishop*, *ἐπίσκοπος*, *episcopus*, was for a time equivalent to presbyter or not) there was in apostolic times an order of presbyters superior in authority to ordinary presbyters, consisting of the twelve apostles, other apostles, and their colleagues, who transmitted so much of their authority as was to be used in continuing and governing the ministry to successors, called *bishops* after the first century, constituting an order which has continued till the present day. 2. The state of being a bishop; episcopal rank or office.

Under Canute and his successors the practice of investiture with the ring and staff, or crozier, seems to have

been begun. Those emblems of *episcopacy* were sent by the chapter to the King, when a vacancy occurred, and were returned by him with a notification of the person whom he appointed.
R. W. Dixon, Hist. Church of Eng., iii., note.

Addison, Remarks on Italy (ed. Bohn), I. 368.

2. [*cap.*] Of or pertaining to the Episcopal Church, especially some branch of the Anglican Church specifically so called; relating to or connected with Episcopalianism: as, *Episcopal* principles or practices; an *Episcopal* clergyman or diocese; the Protestant *Episcopal* liturgy.—**Episcopal bench.** See *bench*.—**Episcopal chaplain.** See *chaplain*.—**Episcopal ring.** Same as *bishop's ring* (which see, under *bishop*).—**Episcopal staff.** See *staff*.—**The Episcopal Church**, the name popularly given to the Anglican Church in a broad sense, in the United States and elsewhere. (See *Anglican Church* (*b*), under *Anglican*, and *Church of England*, under *church*.) In the Protestant Episcopal Church in the United States each diocese has its own bishop, and a diocesan convention consisting of clerical members and lay members representing the parishes. This convention elects the bishop and legislates for the diocese. A General Convention, consisting of a House of Bishops and a House of Clerical and Lay Deputies from the dioceses, meets triennially, and is the supreme ecclesiastical legislature. The senior bishop, with the title of Presiding Bishop, has the presidency among the bishops, and represents the church to foreign churches. Each parish and congregation is governed in spiritual matters by the rector or priest in charge, while temporal affairs are intrusted to the churchwardens and the vestry elected by the people. The rector is elected by the vestry and appointed by the bishop. The Apostles' and the Nicene Creed and the Thirty-nine Articles are the standards of doctrine in both the English and American branches of the church; but the American church omits the Athanasian Creed, which the English church retains, and has made some alterations in the Thirty-nine Articles, omitting Article xxi. The church acknowledges two sacraments, baptism and the Lord's Supper, as generally necessary to salvation (see *sacrament*), practises infant baptism, admits none to communion till confirmed or ready and desirous to be confirmed, suffers those only to officiate as ministers who have received episcopal orders, and does not agree doctrinally with either Arminians or Calvinists. There are three vaguely defined parties in the Episcopal Church. Those who especially emphasize the apostolic origin and authority of the church in contradistinction to non-Episcopal denominations are popularly called *High-churchmen*, and those who attach less importance to this distinction are known as *Low-churchmen*. (See *High-churchman*, *Low-churchman*.) Those who urge the largest liberty of faith and practice within the church communion are called *Broad-churchmen*. Those of rationalizing tendencies generally affiliate themselves with this party; hence the name *Broad Church* is often used to signify a rationalistic element in the Episcopal Church and even in non-Episcopal denominations.

[L. *epithalamium* (neut., sc. *carmen*), < Gr. *ἐπιθαλάμιος*, (m., sc. *ὑμνος*; fem., sc. *ᾠδή*), a nuptial song, prop. adj., of or for a bridal, nuptial, < *ἐπί*, upon, + *θάλαμος*, a bedroom, bride-chamber: see *thalamus*.] A nuptial song or poem; a poem in honor of a newly married person or pair, in praise of and invoking blessings upon its subject or subjects.

I made it both in form and matter to emulate the kind of poem which was called *epithalamium*, and (by the ancients) used to be sung when the bride was led into her chamber. *B. Jonson*, Masque of Hymen.

The book of the Canticles is a representation of God in Christ, as a bridegroom in a marriage-song, in an *epithalamion*. *Donne*, Sermons, vii.

epithalamy† (ep-i-thal′a-mi), *n.* Same as *epithalamium.*

Those [rejoicings] to celebrate marriages were called songs nuptiall, or *Epithalamies*, but in a certaine misticall sense. *Puttenham*, Arte of Eng. Poesie, p. 37.

Sanctvm-Sanctorvm is thy Song of Songs, . . .
Where thou (devoted) doost divinely sing

epitheca (ep-i-thē′kạ), *n.*; pl. *epithecæ* (-sē). [NL. (cf. Gr. *ἐπιθήκη*, an addition, increase), < Gr. *ἐπί*, upon, + *θήκη*, a case: see *theca.*] **1.** In *zoöl.*, a continuous external layer investing and surrounding the thecæ of certain corals. It is the external indication of tabulæ, and is well seen in the *Tubiporæ*, or organ-pipe corals. It is a secondary calcareous investment, probably a tegumentary secretion, very commonly developed both in simple and in compound corals. In the former it is placed outside the proper wall, to which it may be closely applied, or separated by the costæ. It may be very thin or quite dense, and in the latter case it is developed at the expense of the proper wall, which is then often indistinguishable. In compound corals it is not unusual to find a well-formed epitheca inclosing the whole corallum below, while each individual corallite has its own wall. See *tabula.*

2. [*cap.*] In *entom.*, a genus of neuropterous insects, of the family *Libellulidæ*, or dragonflies.

★**epithecal** (ep-i-thē′kạl), *a.* [< *epitheca* + *-al.*] Pertaining to an epitheca.

Cells placed side by side, and forming one or more layers which invest the surface of the body or the walls of the internal spaces, are called *epithelial*. *Epithelial* tissue, then, consists simply of cells.

★**epithelium** (ep-i-thē′li-um), *n.* [NL., orig. used to designate the outer layer of the integument of the lips, which covers the papillæ; < Gr. *ἐπί*, upon, + *θηλή*, the nipple, teat, < *θάειν*, suckle.] **1.** In *anat.*, the superficial layer of cells of mucous membranes, covering the connective-tissue layer, corresponding to the epidermis of the outer skin and continuous with it at the mouth and other natural openings. The usual meaning of the word, however, is somewhat wider than this, and includes all tissues similar in structure to the above. It embraces the proper tissue of secreting glands, whether derived from the hypoblast, as in the case of the gastric and intestinal glands, the liver and the pancreas, or from the epiblast, as in the case of the sudoriparous, sebaceous, and mammary glands, or from the mesoblast, as in the case of the kidneys, ovaries, and testes; it is applied, moreover, to the ependyma of the cerebrospinal ventricular cavities and to the epidermis itself. With what seems a distinct widening of its meaning, the term is not infrequently employed to designate the endothelium of blood- and lymph-channels and of serous membranes. The epithelium is thus the covering of all free surfaces, mucous, external, and even serous, and forms the glands and other organs derived from these coverings. Epithelial tissue consists of cells, usually compactly set; the nuclei are usually distinct, with an intranuclear network and nucleoli. The intercellular substance is scanty, often inappreciable, and is called *cement.* It contains no blood-vessels or lymphatics, but nerve-fibrils extend into it. The epithelial tissue, forming the outermost covering of free surfaces, is favorably situated for performing protective and secreting functions. The protective function is not only exhibited by the general layer of easily replaced cells coating the mucous membrane and outer skin, but in the latter case by a peculiar tendency to form keratin, and this results in a quite impervious outer horny layer, which guards against minor violence, the absorption of deleterious substances, and the invasion of pathogenic bacteria, as well as in the development of such especial means of protection as scales and feathers, hair and nails. This chemical feature of that epithelium which is especially devoted to protection, the production of keratin, can be matched by no single peculiarity on the part of the secretory epithelium; for that must respond equally whether it is called upon to eliminate waste products, or to elaborate digestive ferments, or to manufacture milk. It is probable that some of the cells lining the digestive tract have an active absorptive function with reference to the products of digestion, and that they select and take up certain substances from the intestine, and after more or less elaboration pass them on to the blood- or lymph-channels. This forms a kind of inverted secretion. The epithelial cells of secreting glands are, in part at least, under the direct control of the nervous system. Whether epithelial cells having a purely protective function are, as regards their nutrition, under similar control is still a question. See cuts under *Malpighian* and *villus.*

The *epithelium* is the epidermis of the mucous membrane. *Wilson*, Anat. (1847), p. 540.

2. In *ornith.*, specifically, the dense, tough cuticular lining of the gizzard. It is sometimes even bony, and sometimes deciduous.—**3.** In *bot.*, a delicate layer of cells lining the internal cavities of certain organs, as the young ovary, etc.: also applied to the thin epidermis of petals.—**Ciliated epithelium**, any variety of true epithelium the cells of which are individually furnished on their free surface with cilia. The cells are usually of columnar form, packed closely side by side, with the cilia on their exposed ends. These cilia are microscopic processes of the cell, like eyelashes from an eyelid, and keep up a continual lashing or vibratile motion, by which mucus is swept along the passages. Ciliated epithelium is found in man in the whole respiratory tract, the middle ear and Eustachian tube, the Fallopian tubes and part of the uterus, in portions of the seminal passages, and in the cavities of the brain and spinal cord.—**Columnar or cylindrical epithelium**, epithelium whose cells are more or less rod-like in shape, set on end, and joined together by their sides into a membrane. These cells are usually flattened or somewhat prismatic by mutual pressure. Goblet-cells are a modification of ordinary columnar epithelium cells, scattered here and there among the latter.—**Germinal epithelium.** See the extract.

The epithelial investment of the abdominal cavity retains its primitive character along a tract which corresponds to the rudiment of the primitive kidney longer than it does in other regions; and this epithelial layer may be distinguished as the *germinal epithelium.*
Gegenbauer, Comp. Anat. (trans.), p. 608.

Pavement epithelium, epithelium in which the cells are flattened and coherent by their irregular polygonal edges, like the tiles of a mosaic pavement. Also called *tessellated*, *squamous*, *lamellose*, *lamellar*, and *flattened epithelium.* It may be either *simple*, when it consists of a single layer of cells, as in the epithelium of the pulmonary alveoli, or *stratified*, when it consists of several layers, as in the epidermis.— **Simple epithelium**, any epithelium whose cells form a single layer: distinguished from *stratified epithelium.*— **Spheroidal epithelium**, glandular epithelium, characteristic of the terminal recesses and crypts of the secreting surfaces of glands, with more or less spherical or polyhedral cells.—**Stratified epithelium**, any epithelium whose cells are in two or more layers or strata, one upon another.—**Tegumentary epithelium**, the epidermis.—**Tessellated epithelium.** Same as *pavement epithelium.*—**Transitional epithelium**, stratified epithelium of three distinguishable layers of cells, such as occurs in the ureters and urinary bladder.—**Vascular epithelium**, the epithelial or endothelial lining of blood-vessels and lymphatics.

They are also called *Ichthyophthira*. *Chondracanthus gibbosus*, a louse of the angler (*Lophius piscatorius*), is an example. See *Chondracanthus* and *fish-louse*.

★**epoch** (ē′pok or ep′ok), *n.* [= F. *époque* = Sp. Pg. It. *epoca* = D. *epoque* (< F.) = G. *epoche* = Dan. *epoke* = Sw. *epok*, < ML. *epochá*, < Gr. ἐποχή, a check, cessation, stop, pause, epoch of a star, i. e., the point at which it seems to halt after reaching the highest, and generally the place of a star; hence, a historical epoch; < ἐπέχειν, hold in, check, < ἐπί, upon, + ἔχειν, have, hold, = Skt. √ *sah*, bear, undergo, endure.] **1.** A point of time from which succeeding years are numbered; especially, a point of time distinguished by some remarkable event, or the event itself as distinguishing the time of its occurrence.

It is an *epoch* in one's life to read a great book for the first time. *J. F. Clarke*, Self-Culture, p. 318.

3. In *geol.*, specifically, one of the shorter divisions of geological time. This word is used differently by different geological writers. Thus, Jukes divides the entire series of fossiliferous strata into only three epochs, while Dana makes eight out of the Lower Silurian alone. Some later writers avoid the use of such words as *epoch* and *age*, saying, for instance, instead of *Silurian epoch* or *age*, simply *Silurian*. In the use recommended by the International Congress of Geologists, an epoch is the time during which a series of sediments is deposited.

4. In *astron.*, an arbitrary fixed date, for which the elements of a planetary or cometary orbit, or of any motion, are given.—**Antiochian, elephantine, glacial, Gregorian,** etc., **epoch.** See the adjectives.—**Mohammedan, Olympiadic, Persian, Spanish,** etc., **epoch.** See equivalent phrases under *era*.—**Syn. 1.** *Epoch, Era, Period, Age.* *Epoch* and *era* should be distinguished, though in common usage they are interchanged. "An *era* is a succession of time: an *epoch* is a point of time. An *era* commonly begins at an *epoch*. We live in the Christian *era*, in the Protestant *era*, in the *era* of liberty and letters. The date of the birth of Christ was an *epoch*: the *period* of the dawn of the Reformation was an *epoch*" (*A. Phelps*, Eng. Style, p. 365). *Period* may be the opposite of *epoch*, in being the date at which anything ends, or it may be mere duration, or duration from point to point; the word is very free and often indefinite in its range of meaning. The meaning of *age* is modified by its connection with human life, so as often to be associated with a person: as, the *age* of Pericles; but it is also freely applied to time, viewed as a *period* of some length: as, the bronze *age*; the golden *age*; this is an *age* of investigation.

epoch-making (ē′pok-mā″king), *a.* [= G. *epochemachend*.] Constituting an epoch; opening a new era; introducing new conceptions or a new method in the treatment of a subject. [Recent.]

"The Methods of Ethics" was published in 1874, but whether or not most of the joint-work of Profs. Fowler and Wilson was written before that time, it is at least fair to say that the position of Prof. Sidgwick is not dealt with in the way which is demanded by the *epoch-making* character of his book. *Mind*, XII. 596, note.

epode (ep′ōd), *n.* [< OF. *epode*, F. *épode* = Sp. Pg. It. *epodo*, < L. *epodos*, < Gr. ἐπῳδός, an epode, an aftersong, adj., singing to or over, < ἐπί, upon, to, besides, + ἀείδειν, ᾄδειν, sing, > ᾠδή, a song, ode: see *ode*.] **1.** In *anc. pros.*: (*a*) A third and metrically different system subjoined to two systems (the *strophe* and *antistrophe*) which are metrically identical or corresponsive, and forming with them one pericope or group of systems.

As the closing verse of a system, sometimes called *ephymnium*. (*c*) A poem consisting of such distichs. Archilochus (about 700 B. C.) first introduced these. The Epodes of Horace are a collection of poems so called because mostly composed in epodic distichs.

Horace seems to have purged himself from those splenetic reflections in those odes and *epodes*, before he undertook the noble work of satires.

Thus, two collections of objects are equal in number when the operation of counting, applied to the two, ends with the same number; two lengths are equal when either will cover the other; two stars appear of equal brightness when the eye can detect no difference between them in this respect. Quantities of two or more dimensions are equal only when they are equal in each dimension separately. Thus, two vectors are not necessarily equal because they are equal in length; it is necessary that they should also be parallel. It is therefore preferable not to speak of two forces (or anything else capable of representation by vectors) as equal, unless they are parallel. Nevertheless, the prevalent mathematical usage is, or has been until recently, to call two such things equal when their tensors or moduli are equal. On the other hand, common usage presents an opposite inconsistency in refusing to call geometrical figures (particularly triangles) equal unless they can be superposed. Euclid and some modern geometers make it an axiom that figures which can be superposed are equal; but others define equal figures as such as can be superposed.

2. In *math.*, a proposition asserting the equality of two quantities, and expressed by the sign = between them; or an expression of the same quantity in two terms dissimilar but of equal value: as, 3 lb. = 48 oz.; $x = b + m - r$. In the latter case x is equal to b added to m with r subtracted from the sum, and the quantities on the right hand of the sign of equation are said to be the value of x on the left hand. An equation is termed simple, quadratic, cubic, or biquadratic, or of the 1st, 2d, 3d, or 4th degree, according as the index of the highest power of the unknown quantity is one, two, three, or four; and generally an equation is said to be of the 5th, 6th, *n*th, etc., degree, according as the highest power of the unknown quantity is of any of these dimensions.

3. In *astron.*, the correction or quantity to be added to or subtracted from the mean position of a heavenly body to obtain the true position; also, in a more general sense, the correction arising from any erroneous supposition whatever. — **4.** In *chem.*, a collection of symbols used to indicate that two or more definite bodies, simple or compound, having been brought within the sphere of chemical action, a reaction will take place, and new bodies be produced. The symbols of the bodies which react on each other form the left-hand member of the equation, and are connected by the sign of equality with the symbols of the products of the reaction. It is called an equation because the weight of the substances reacting must exactly equal the weight of the products of reaction.—**Abelian equation.** See *Abelian*[2].—**Absolute equation.** See *absolute*.—**Absolute personal equation.** See *personal equation*.—**Adfected or affected equation.** See *adfected*.—**Algebraic equation.** See *algebraic*.—**Bernoulli's equation.** (*a*) The equation $dy/dx = Py + Qy^m$, where P and Q are functions of x only. It is solved by substituting $z = y^{1-m}$. (*b*) An equation for the steady motion of a liquid, namely,

$$\int \frac{dp}{\rho} + V + \tfrac{1}{2}q^2 = C,$$

where p is the pressure, ρ the density, V the potential of the impressed forces, q the velocity, and C a constant for each stream-line and vortex-line, and in the case of irrotational motion a constant for all space.—**Bessel's equation**, the equation $d^2y/dx^2 + x^{-1}dy/dx + (1 - \nu^2/x^2)y = 0$, the solution of which involves the Besselian function.—**Binomial equation.** See *binomial*.—**Biquadratic equation.** Such equations were first solved by the Italian mathematician Ludovico Ferrari (1522–65). His method

is as follows: Let the biquadratic be $x^4 + ax^3 + bx^2 + cx + d = 0$. Find a root of the cubic $y^3 - by^2 + (ac - 4d)y - d(a^2 - 4b) - c^2 = 0$. Then the roots of the biquadratic are the same as those of the two quadratics

$$(a^2 - 4b + 4y)(2x^2 + ax + y)$$
$$\pm \sqrt{a^2 - 4b + 4y}\,[x(a^2 - 4b + 4y) + ay - 2c] = 0.$$

Canonical equation, an equation brought into a standard form; especially, the Lagrangian and Hamiltonian equations of dynamics.—**Characteristic equation,** an algebraic equation which leads to the solution of a linear differential or difference equation with constant coefficients.—**Chemical equation.** See *chemical.*—**Circulating equation,** a difference equation in which the coefficients take successive forms of a cycle of forms for successive values of the variable. Thus, if we have the equation $u_{x+1} + P_x u_x = 0$, where $P = 1$ when x is divisible by 3, $P = x$ when $x - 1$ is divisible by 3, and $P = 2^x$ when $x + 1$ is divisible by 3, the equation given is a circulating equation.—**Clairaut's equation,** the equation $y = x\,dy/dx + F(dy/dx)$.—**Complete equation.** See *incomplete equation.*—**Compound equation.** Same as *adfected equation.*—**Connected equations,** a system of equations such that one of them can be deduced from the rest.—**Constitutive equation,** the equation which expresses the conditions of a problem.—**Construction of equations.** See *construction.*—**Conversion of equations.** See *conversion.*—**Cubic equation,** an equation of the third degree. The algebraic solution of the general cubic equation was discovered by Scipione dal Ferro (died 1525?) His method, commonly known as that of Cardan, and perfected by Hudde, is as follows: Let the cubic equation be $x^3 + 3ax^2 + 6bx + 2c = 0$. Calculate three subsidiary quantities, p, q, R, by means of the equations $p = 2b - a^2$, $q = a^3 - 3ab + c$, $R^2 = p^2 + q^2$. Then, denoting by ρ any cube root of unity, and by the radical a real quantity,

$$x = \rho\sqrt[3]{-q + R} + \rho^2\sqrt[3]{-q - R} - a,$$

which gives three values for the three values of ρ. If all the roots are real, this method is inconvenient; and we have the "irreducible case of Cardan's solution," when we may calculate two subsidiary quantities, r and θ, by the equations $r^6 = q^2 - R^2$, $\tan^2 3\theta = -R^2/q^2$, and the three roots will be $x_1 = -2r\cos\theta - a$, $x_2 = -2r\cos(\theta + 120°) - a$, $x_3 = -2r\cos(\theta - 120°) - a$.—**Darboux's equation,** the equation $A\,dx + B\,dy + C(y\,dx - x\,dy) = 0$, where A, B, C are rational functions of x and y.—**Depression of an equation.** See *depression.*—**Derived equation,** the equation which expresses the vanishing of the differential coefficient of a given equation. Thus, if $x^5 + x^3 = x^2 + 1$ is the given equation, the derived equation is $5x^4 + 3x^2 = 2x$.—**Determinate equation,** an equation containing only one unknown quantity, or only as many as there are equations in the system.—**Difference equation,** an equation expressing a relation between the value of a function (or the values of several functions) for all values of the variable or variables and the values when the several variables are increased by 1, 2, 3, etc. Thus, $f(x, y) = f(x + 1, y) + f(x, y - 3)$ is a difference equation. The *order* of a difference equation is equal to the difference between the highest and lowest values of the variable it involves. Thus, the equation just given is of the first order with respect to x and of the third order with respect to y. The *degree* of a difference equation is the degree of the equation in the unknown functions as variables. Thus, $f(x + 2) - [f(x + 1)]^2 + fx = 0$ is a difference equation of the second degree. But some mathematicians would make the degree of a difference equation strictly analogous to that of a differential equation. A linear difference equation with constant coefficients is solved by means of its characteristic equation (which see, above).—**Differential equation,** an equation expressing a relation between functions and their differential coefficients. An *ordinary differential equation* is one which contains only one independent variable: a *partial differential equation* is one which contains two or more independent variables. The *order* of a differential equation is that of the highest differential coefficient it contains. The *degree* of a differential equation is that of the power to which the highest differential coefficient is raised when the equation is in rational form and freed from fractions. A *solution* of a differential equation is an equation containing no differentials nor integrals unless of explicit functions and such that the given differential equation can be deduced from it. A *general solution* is one which is as indeterminate as possible—that is, which contains the number of arbitrary constants or functions indicated by the order of the equation. A *particular solution* is—(*a*) with modern writers, a solution which is a particular case of the general solution; (*b*) with older writers, any solution not general. A *singular solution* is one which is neither general nor implied in the general solution. The *complete integral of a partial differential equation* is a solution containing the full number of arbitrary constants or functions.—**Disjunctive equation.** See *disjunctive.*—**Eminential equation.** See *eminential.*—**Equation of achromaticity,** an equation between the radii of curvature of a compound lens, determining it to be achromatic; also, a similar equation determining the distance between the lenses of an eyepiece.—**Equation of condition.** See *condition.*—**Equation of continuity.** See *continuity.*—**Equation of differences,** the equation for the squared differences of the roots of a given algebraic equation.—**Equation of hydrodynamics,** an equation often used in solving problems in hydrodynamics, expressing a differential relation between the pressure, the components of the velocity, and the forces.—**Equation of Laplace's functions,** the partial differential equation

$$\left\{\left(\sin\theta\,\frac{d}{d\theta}\right)^2 + \left(\frac{d}{d\phi}\right)^2 + n(n+1)(\sin\theta)^2\right\} y = 0.$$

Also called *Laplace's secondary equation.*—**Equation of light.** (*a*) In older writings, the sum of those equations of the moon's motion which depend on its distance from the sun. (*b*) In modern writings, the correction to be applied to the position of a planet or to the time of an eclipse, etc., owing to the finite velocity of light.—**Equation of living force** (vis viva), an equation derived from the immediate application of the principle that the living force added to the potential energy is a constant.—**Equation of moments,** an equation of rigid dynamics expressing the forces of rotation.—**Equation of motion,** the differential equation of dynamics connecting the forces and accelerations.—**Equation of payments,** an arithmetical rule for the purpose of ascertaining at what time it is equitable that a person should make payment of a whole debt which is due in different parts payable at different times.—**Equation of rest,** a special case of the equation of motion, showing the conditions of equilibrium.—**Equation of the argument,** in *old astron.*, the angle at the earth between a planet and the center of its epicycle; but in the cases of the sun and moon, the difference between the true and mean places. (*Clavius,* In Sacro Bosco.)—**Equation of the center.** (*a*) In *old astron.*, usually, the difference between the true and mean place of the center of the epicycle (*Short,* Kepler, § 43); but in the case of the moon, generally the angle at the center of the epicycle between the true and mean apogee (*Clavius; Ozanam*), but sometimes the first inequality (*Halma,* Almagest, V. vii.). (*b*) In *modern astron.*, the excess of the true over the mean anomaly. (*Gauss,* Theoria Motus, I. 7.)—**Equation of the orbit,** in *old astron.*: (*a*) The total correction of the mean place of a planet to give its true place. (*b*) The equation of the argument. If, for example, two observers note the times of passage of a series of stars over the same meridian, it will generally be found that one observer has a tendency to note the time later than the other, so that the mean difference, say for sets of twenty-five observations, presents some approach to constancy. In consequence of this, if we have to combine observations of the two observers, it will be proper to apply to all the observations of one of them a constant, in order to give the times such as they would have been observed by the other. This constant is the personal equation. The *absolute personal equation* is the amount which has to be added to the time as observed by any given observer in order to reduce the error of the mean of a large number of his observations to zero, or as nearly so as possible by any such constant correction. The personal equation is said to be eliminated when the observations are so treated that it does not affect the result. Thus, in determining the difference of longitude of two stations by the telegraphic transmission of the times of transit of stars over the two meridians, the result will be affected by the personal equation between the observers at the two stations. But if the observers afterward change places and redetermine the difference of longitude, the personal equation will enter into this second result with the opposite sign to that which it had before. Consequently, the mean of the two results will give a third result which is free from the effect of any constant personal equation. Hence, loosely—(*b*) Any kind of tendency to error of a determinate kind and amount peculiar to a given observer or reasoner for which it is possible to make any approximate allowance.—**Physical equation,** in *astron.*, the displacement of a planet from the position which an equable circular motion would give it owing to the eccentricity of the orbit being only one half that of the equant.—**Primitive equation,** any equation from which another is derived in any way.—**Pure equation,** one in which each unknown occurs to only one degree.—**Quadratic equation,** an equation of the second degree. Such equations were solved by the ancients. Given $Ax^2 + 2Bx + C = 0$, the solution is

$$x = -\frac{B}{A} \pm \frac{B}{A}\sqrt{1 - \frac{AC}{B^2}}.$$

When B^2 is much larger than $\pm AC$, the two roots are nearly

$$-\frac{2B}{A} + \frac{C}{2B} \quad \text{and} \quad -\frac{C}{2B} + \frac{AC^2}{8B^3}.$$

In *astron.,* that imaginary great circle in the heavens the plane of which is perpendicular to the axis of the earth. It is everywhere 90° distant from the celestial poles, which coincide with the extremities of the earth's axis, supposed to be produced to meet the heavens, and its axis is this produced axis. It divides the celestial sphere into the northern and southern hemispheres. During his apparent yearly course the sun is twice in the equator, in the months of March and September. Then the day and night are everywhere equal, whence the name *equator.*

2. In *geog.,* that great circle of the earth every point of which is 90° from the earth's poles, which are also its poles, its axis being also the axis of the earth. It is in the plane of the celestial equator. Our earth is divided by it into the northern and southern hemispheres. From this circle is reckoned the latitude of places both north and south.

II. *n.* An astronomical telescope so mounted that it can be directed upon any celestial object of which the right ascension and declination are known, and can be made to follow the object for any length of time notwithstanding the diurnal motion. For these purposes a principal axis resting on firm supports is placed parallel to the axis of the earth's rotation, and consequently pointing to the poles of the heavens. On this polar axis there is placed, usually near one of its extremities, a graduated circle, the plane of which is perpendicular to the polar axis, and therefore parallel to the equator. This circle is called the *equatorial circle,* and measures by its arcs the hour-angles, or differences of right ascension. The polar axis carries at right angles to itself a second axis, called the *declination axis,* to which the telescope and a second graduated circle, called the *declination circle,* are attached. This circle measures by its arcs differences of declination. The name *equatorial,* or *equatorial instrument,* is sometimes given to any astronomical instrument which has its principal axis of rotation parallel to the axis of the earth. See under *telescope.*

Our rational and sensitive propensions are made in such a regular and *equilibrious* order that, proportionably as the one does increase in activity, the other always decays.
J. Scott, Christian Life, i. 2.

equiliriously† (ē-kwi-lib′ri-us-li), *adv.* In an equilibrious or balanced manner; in equipoise.

equilibrity (ē-kwi-lib′ri-ti), *n.* [< L. *æquilibrita(t-)s*, < *æquilibris*, evenly balanced: see *equilibrium*.] The state of being equally balanced; equal balance on both sides; equilibrium; equipoise: as, the theory of *equilibrity*.

★**equilibrium** (ē-kwi-lib′ri-um), *n.* [Formerly also *æquilibrium*; = F. *équilibre* = Sp. *equilibrio* = Pg. It. *equilibrio*, < L. *æquilibrium*, an even balance, a horizontal position, < *æquilibris*, level, horizontal, evenly balanced, < *æquus*, equal, + *libra*, a balance: see *libra*.] **1.** Equipoise; the state of being equally balanced; a situation of a body in which the forces acting on it balance one another; also, a determination of forces such that they balance one another, so that their resultant vanishes. Thus, when a heavy body rests on a table, the weight and the elastic forces which the weight evokes are *in equilibrium* (a phrase often used in the Latin form *in æquilibrio*, or more commonly *in equilibrio*)—that is, are precisely equal and opposite; thus, a man walking a tight-rope usually carries a pole or balancing-rod to aid him in preserving his equilibrium—that is, in keeping his center of gravity over the rope, so that his weight and the spring of the rope may act in the same vertical line. Similarly, a floating body is in equilibrium when its weight and the upward pressure or buoyancy of the liquid are exactly equal and opposite. When a body, being slightly moved out of its position, always tends to return to its position, the latter is said to be one of *stable equilibrium*; when a body, on the contrary, once removed, however slightly, from the position of equilibrium, tends to depart from it more and more, like a needle balanced on its point, its position is said to be one of *unstable equilibrium*; and when a body, being moved more or less from its position of equilibrium, will rest in any of the positions in which it is placed, and is indifferent to any particular position, its equilibrium is said to be *neutral* or *indifferent*. A perfect sphere, of uniform material, resting upon a horizontal plane, is in a state of neutral equilibrium; an oblate spheroid with its axis of rotation vertical is in stable equilibrium; while a prolate spheroid with its axis vertical is in unstable equilibrium on the same plane. A body suspended by its center of gravity is in a state of neutral or indifferent equilibrium. If a body is suspended by any other point, it will be in a state of stable equilibrium when its center of gravity is perpendicularly below the point of suspension; but if the center of gravity is above the point of suspension, the equilibrium will be unstable.

If any forces, acting on a solid or fluid body, produce *equilibrium*, we may suppose any portions of the body to become fixed . . . without destroying the *equilibrium*.
Thomson and Tait, Nat. Phil., § 564.

When at rest under the action of two equal and opposite forces, a point is said to be in *equilibrium*.
R. S. Ball, Exper. Mechanics, p. 6.

Center of equilibrium. See *center*1.—**Relative equilibrium,** the instantaneous equilibrium of a particle; a situation from which a particle does not tend to move so long as other particles are held in their actual positions. Thus, a drop of water on the crest of a wave is in *relative equilibrium*.—**Thermal equilibrium,** such a distribution of heat within a gas subject to external forces (say the atmosphere) that no slow currents of its parts will alter the distribution of the heat in space. Thus, if the increase of pressure due to bringing a portion of air from any height to the earth would increase its temperature just enough to bring that air to the temperature of the surrounding air, the atmosphere would be in *thermal equilibrium*.

Equimultiples are always in the same ratio to each other as the numbers or quantities multiplied. If 6 and 9 are each multiplied by 4, the equimultiples 24 and 36 will be to each other as 6 to 9.

S. Butler, Hudibras, I. iii. 1034.

equinia (ę-kwin′i-ą), *n.* [NL., < L. *equinus*, of a horse: see *equine*.] A dangerous infectious disease, communicated usually by contagion, occurring principally in horses, asses, and mules, but also occasionally in other domestic animals except cattle, and in man. The salient features of the disease are the formation of small tubercles, breaking down into ulcers, and the diffuse infiltration of large and irregular patches with a serous fluid containing numerous round cells. In addition, abscesses of considerable size are formed, and the lymphatics become inflamed and swollen. These processes go on for the most part in the cutaneous and subcutaneous tissues, and in the mucous and submucous tissues of the lungs and air-passages, especially the nose. If the cutaneous symptoms are in abeyance while the mucous membrane of the nose is severely affected and the discharge profuse, the disease is called *glanders*; if the cutaneous symptoms are well developed while the discharge from the nose is insensible, it is called *farcy*. Each of these forms may be either acute or chronic. Equinia in man is in a majority of cases fatal. It is caused by a bacillus of about the size of the tubercle-bacillus, known as the *glanders bacillus*.

The immediate inference of *equipollence* is merely the grammatical translation of an affirmation into a double negation, or of a double negation into an affirmation.
Sir W. Hamilton.

3. In *math.*, equality of length with parallelism of direction.

These planes and their bounding line around the mountain are called with respect to gravitation *equipotential* planes and *equipotential* lines.
J. Trowbridge, New Physics, p. 164.

Equipotential line, a line drawn on an equipotential surface; one along which the potential is everywhere the same. Thus, if two points in an electrically equipotential line be joined by a conductor, no flow through the conductor will take place.—**Equipotential surface**, a surface throughout which the potential (see *potential*) is everywhere the same; one which is everywhere perpendicular to the lines of force which it meets. If a particle were subject to the attractions and repulsions of a number of bodies that were held motionless, there would be a resultant force upon it in some certain direction. If, while held so that it could not acquire momentum, it were either allowed to move as urged by the resultant force or compelled to move directly counter thereto, it would describe a course, called a *line of force*, having an attracting body at one extremity and a repelling one at the other, or else passing off to infinity in one direction or the other, or running back into itself in a closed circuit, as the lines of magnetic force. Through every point of space there would be such a line; and a surface so bending as to be everywhere perpendicular to these lines of force would be an *equipotential* or *level surface*. If such a surface were to be rendered impenetrable, the particle could lie upon it without tendency to move along it in any direction. Similarly, if any two points of an electrically equipotential surface are joined by a conductor, no flow will take place. The term *equipotential* is most generally used as applying to electrical or magnetic forces.

Equipotential Lines about two similarly electrified spheres, *A* and *B*, the quantities of electricity being as 2 : 1. The lines of force are also shown radiating from the spheres. (Maxwell.)

Equisetaceæ (ek″wi-sē-tā′sē-ē), *n. pl.* [NL., < *Equisetum* + *-aceæ*.] A distinct family of plants, of the series *Pteridophyta*. Perennial, solid, running rootstocks are present in most cases, producing usually upright hollow stems with a grooved surface. In addition to the central canal of the latter, there is near the surface a circle of smaller canals (vallicular canals), opposite to the grooves (valliculæ) which mark the surface. Opposite the ridges is another set of still smaller cavities (carinal canals). The stomata are in the grooves, in some species forming a row on each side of the groove. The cuticle of the stem in many species contains a large amount of silica. The stem is jointed, and the central canal is intercepted by a partition (diaphragm) at each joint. Each joint bears at its upper end a circle of leaves which are united to form a sheath, while their tips project as teeth, which are deciduous in some species, in others persistent. Branches, when present, are formed in whorls at the joints of the stem, which they resemble, except in the absence of the central canal; and these may be again branched. The stems are either perennial and evergreen or annual. The fructification, borne either by the vegetative stems or by special fruiting stems, is a terminal conical structure whose central axis bears numerous angular, shield-shaped bodies (clypeolas) attached by horizontal pedicels. Each clypeola bears from 6 to 9 sporangia, which open on their inner side and discharge their spores. The spores are spherical. The outer coat breaks into four slender, club-shaped filaments (elaters), which are attached to one side of the spore, and are coiled about it when moist, uncurling when dry. Their elasticity aids the discharge of the spores from the sporangia, and favors distribution. The germination of the spores results in irregularly lobed diœcious prothallia above ground. *Equisetum* is the only genus. See cut in preceding column.

Equisetites (ek″wi-sē-tī′tēz), *n.* [NL., < *Equisetum* + *-ites*.] A genus of fossil plants, belonging to the family *Equisetaceæ* (which see), closely resembling the living genus *Equisetum*. It differs from *Calamites* in having the leaves attached to a common sheath, as in *Equisetum*. The genus ranges from the Lower Carboniferous (*E. mirabilis*) to the Jurassic, but some of the later forms should perhaps be more properly classed with *Equisetum*. It doubtless forms the transition from the *Calamariaceæ* to the *Equisetaceæ*. There is much difficulty in classifying the fossil *Equisetaceæ*, in consequence of the imperfect preservation of important portions of the specimens studied. By some authors the genus *Equisetites* is not admitted as having been clearly established.

Equisetum (ek-wi-sē′tum), *n.* [NL., < L. *equisætum*, *-sæta*, *-sætis*, < *equus*, a horse, + *seta*, *sæta*, a bristle.] A genus of plants, constituting alone the family *Equisetaceæ*. There are about 25 species known, of which 10 are found in Great Britain and 14 in North America, some being common to both countries. The cuticle abounds in silica, on which account the stems of some species are used for polishing wood and metal. *Equisetum hiemale*, the scouring-rush, is best suited for this purpose, and is largely imported into England from the Netherlands. The branching species of *Equisetum* are popularly called *horsetails*. See cut in preceding column.

Hamilton*, Federalist, No. lxxx.

Equitable assets. (*a*) Property not leviable under execution, and only to be reached by interposition of a court of equity. (*b*) Property belonging to the estate of a decedent by law not subject to payment of his debts in course of administration, but voluntarily charged by the testator with payment of debts generally, or upon which equity fastens a trust for that purpose.—**Equitable conversion,** a transformation of a fund from real to personal or from personal to real, assumed in equity to have been made in order to secure the application to the succession to or administration of that fund of the principles which the intention of a testator or the rights of parties interested require. Thus, where a will imperatively directs real property to be sold and distributed as money, the court may treat the fund as equitably converted from the testator's death, although the executors neglect to make an actual conversion into money.—**Equitable defense** or **plea,** a defense or plea which, though it would not be available at common law, is available under the rules of equity.—**Equitable disseizin, estate, estoppel, mortgage, owner, seizin, waste,** etc. See the nouns.—**Equitable title.** See *equitable estate*, under *estate*.—**Syn. 1.** Fair, upright, honest, even-handed.

The equites, or the *equestrian order* (in distinction from the *senatorial order*), finally lost in great part their distinctive military character, and were constituted as a class intermediate between the senatorial order and the ordinary citizens, based on certain limits of property, with a prescriptive right to judicial and financial offices, to high military rank, and to some social distinctions.

Equity in Law is the same that the Spirit is in Religion, what every one pleases to make it. *Selden*, Table-Talk, p. 46.

(*b*) The system of jurisprudence or body of doctrines and rules as to what is equitable and fair and what is not, by which the defects of, and the incidental hardships resulting from, the inflexibility of the forms and the universality of the rules of the common-law tribunals are corrected or remedied, and substantial justice is done. In the early history of the English people it was found, as society advanced, that many grievances arose which were not included in the classes of cases which the common law authorized the judges to take cognizance of. Hence it became customary for those who could not obtain redress in the courts, because no common-law action appropriate to their grievance had been sanctioned, or because the common law, while equitable and fair in its general application, was unfair in its application to their particular case, to apply to the king in Parliament or in council for justice. Petitioners in such cases (if it could be shown that there was no adequate remedy at law, or that the operation of the common law was unfair in its application to the particular case in hand) were referred to the chancellor (originally an ecclesiastic), the keeper of the king's conscience, who, after hearing the parties, required what was equitable and just to be done, under penalty of imprisonment, excommunication, etc. Thus, the common-law remedy of collecting a debt by getting judgment and execution became established at a time when property consisted almost entirely of lands and goods; but as wealth increased, and appeared in the forms of intangible property, such as valuable rights in action, contracts, securities, patents, copyrights, etc., the chancellor would entertain a complaint (called a *bill in equity*) from a creditor, setting forth that he was unable to collect his judgment out of property that could be reached by legal process, and that the debtor had other property which ought to be applied in payment, and asking that the defendant be compelled to do what equity and good conscience required to be done. The chancellor (the Court of Chancery) could compel the debtor to assign his intangible property to a receiver, a mode of relief which the law had never conferred on a sheriff the power to afford. Or if a creditor, to secure his demand, obtained from his debtor a deed which in terms was an absolute conveyance, and was proceeding to enforce it as if it were so intended, the Court of Chancery would entertain a complaint from the debtor offering to pay the debt, and asking to be allowed to redeem the land. The steady growth of the complexities of property and of business and social relations increased the cases requiring equitable remedies to supply the deficiency of common-law remedies, or equitable interference with the unconscionable enforcement of common-law rules, until the procedure in equity developed a substantive system of doctrines and remedies covering a great variety of subjects scarcely contemplated by the common law. In England and the United States the doctrines of the common law have now generally been subjected to the established modifications introduced by equity, and in many jurisdictions the two systems of rules thus merged and modified are administered by the same courts. This new system is generally known in the United States as the *code practice*, or the *new* or *reformed procedure*.

There is not . . . a single department of the law which is more completely fenced in by principle, or that is better limited by considerations of public convenience, both in doctrine and discipline, than *equity*. *Story*, Misc. Writings, p. 540.

(*c*) The court or jurisdiction in which these doctrines are applied: as, a suit in *equity*. (*d*) An equitable right; that to which one is justly entitled; specifically, a right recognized by courts of equity which the common law did not provide for: as, the wife's *equity*, or her right, when her husband sought to enforce his common-law claim to reduce her property to his own possession, to have a portion of it settled on herself. (*e*) The remaining interest belonging to one who has pledged or mortgaged his property, or the surplus of value which may remain after the property has been disposed of for the satisfaction of liens. [U. S.] (*f*) A right or obligation incident to a property or contract as between two persons, but not incident to the property or contract from its own nature. In this sense used in the plural. *Rapalje and Lawrence.*—**Equity of a statute,** effect given to a statute in accordance with what is deemed its reason and spirit, which might not be given to it by a strictly literal reading.—**Equity of redemption.** (*a*) The right of a mortgager or a pledger by absolute deed to redeem the property by paying the debt, even after forfeiture, but before sale under foreclosure, or unconditional transfer of title, or before this right is barred by statutes of limitation. (*b*) In conveyancing, in the United States, the ownership of or title to real property which is subject to a mortgage: sometimes simply called *equity*.—**Equity side of the court,** or **equity term,** in a court in which both equity and the common law are separately retained and administered, a session or a term in which causes in equity are heard, as distinguished from those in which common-law causes are heard.—**Syn. 1.** Rectitude, fairness, honesty, uprightness.—2. *Right, Law*, etc. See *justice*.

2. In *geol.*, a stratum or series of strata in one district formed contemporaneously with a stratum or series of a different lithological character in a different region, or occupying the same relative position in the scale of rocks, and agreeing in the character of its fossils if deposited under similar circumstances: thus, the Caen building-stone of France is the *equivalent* of the English Bath oölite.—**Endosmotic equivalent.** See *endosmotic.*—**Law of equivalents,** in *chem.*, the law that the several combining weights of any number of bodies which form compounds with a given other body are either the same or simple multiples of the combining weights of these several bodies when they form compounds with one another. Thus, if a body A unite with other bodies B, C, D, then the quantities B, C, D (the letters being used to denote the combining quantities as well as the bodies) which unite with it, or some simple multiples of these quantities, represent for the most part the proportions in which they unite among themselves. The various quantities A, B, C, D (or multiples of them) are termed the *equivalents* of one another. Thus, 1 part by weight of hydrogen unites with 8 parts by weight of oxygen to form water, with 35.5 of chlorin to form hydrochloric acid, with 16 of sulphur to form sulphureted hydrogen; these quantities or their multiples are therefore regarded as equivalents of one another, 8 parts of oxygen uniting with 35.5 of chlorin to form chlorin monoxid (Cl_2O), and 16 of sulphur with 8×2 of oxygen to form sulphur dioxid (SO_2). When the atomic weights are taken into account (H = 1, O = 16, S = 32, Cl = 35.5), it is seen that one atom of hydrogen is the combining equivalent of one of chlorin, and two atoms of hydrogen of one of oxygen or one of sulphur; and taking the quantivalence of hydrogen as unity, chlorin is *univalent*, oxygen and sulphur are *bivalent*. Upon this equivalency or quantivalence of the different elements is based their classification into *monads, dyads, triads, tetrads*, etc., and accents (sloping strokes) are frequently appended to the symbols in a formula to show to which class the bodies belong, as H_2O'', $N'''H_3$, $C''''H_4$ or $Ci^{v}H_4$.—**Mechanical or dynamic equivalent of heat,** in *physics*, the amount of mechanical energy which is equivalent to (that is, which when transformed into heat will produce) one heat unit. This constant quantity has been determined in several ways. The first accurate experiments were by Joule, who measured the amount of heat produced by the friction of a paddle-wheel in a vessel of water, the energy required to turn the paddle being supplied by a known weight descending through a known distance. Joule found that to raise one pound of water 1° F. (heat unit), 772 foot-pounds of mechanical work were required. In the c. g. s. system the mechanical equivalent, often called Joule's equivalent, is 4.184×10^7 ergs per gram-degree centigrade.—**Morphological equivalents,** the similar forms which occur in different genetic series having a common origin, and probably due to similar causes. *A. er†, *adv.* A Middle English form of *ere*[1].

-er[1]. [< ME. *-ere* (in early ME., as in AS., the final *e* was sounded), < AS. *-ere* = OS. *-eri* = OFries. *-ere*, *-er* = D. *-er* = MLG. *-ere*, *-er*, LG. *-er* = OHG. *-āri*, *-ări*, *-eri*, MHG. *-ære*, *-er*, G. *-er* = Icel. *-ari* = Sw. *-are* = Dan. *-er* = Goth. *-areis;* a common Teut. formative, suffixed to verbs to form nouns of the agent, as in AS. *bæcere*, a baker, *creópere*, a creeper (cripple), *delfere*, a delver, etc.; = L. *-āriu-s* (whence directly E. *-ary*[1], *-ari-an*, and ult. *-er*[2]) = Gr. *-ήριο-ς* (in L. and Gr. forming adjectives (used also as nouns) from nouns or verbs); orig. a compound suffix, < *-ar + *-ia*.] An English suffix, originally and properly attached to verbs to form nouns of the agent, as in *baker*, *creeper*, *delver*, *driver*, *reader*, *sower*, *writer*, etc. Though denoting usually a person, it may denote also, or only, a thing, as *ruler*, *heater*, *grater*, *poker*, etc. In use it is equivalent to the Latin *-or* in such forms as *instructor*, one who instructs, *actor*, one who acts, *confessor*, one who confesses, etc. Accordingly, English verbs from Latin supine or perfect participle stems may form their noun of the agent with English *-er*[1] or Latin *-or*: *instructer* or *instructor*, *confesser* or *confessor*, etc. Usually they prefer the Latin form, taking it directly (or mediately through Middle English *-our*, < Old French *-our*, < Latin *-or*, etc.) from the Latin, or forming it by analogy (as *depositor*, *radiator*, etc., for which there is no Latin original). The suffix *-or* is thus a rough means of distinguishing words of Latin origin: compare *auditor*, *instructor*, *factor*, etc., with their literal English equivalents *hearer*, *teacher*, *doer*, etc. In many words, as *biographer*, *geographer*, *philologer*, *philosopher*, etc., there is no accompanying verb, the suffix, which is equally referable to *-er*[2], being attached, cumulatively (first in *philosopher*), to the original (Latin or Greek) term signifying an agent. (See *-er*[2].) In another use, also without reference to a verb, *-er*, attached to names of towns or countries, signifies an inhabitant of or one who belongs to the town or country, as *Londoner*, *New-Yorker*, *Hollander*, *Englander*, *New-Englander*, etc., like German *Berliner*, *Leipziger*, *Engländer*, *Holländer*, etc.

-er[2]. [< ME. *-er*, *-ere*, < OF. *-er*, *-ier*, F. *-ier* = Sp. Pg. *-iero*, *-ero* = It. *-iere*, *-ero*, < L. *-ārius* (whence directly E. *-ary*[1], *-ari-an*, as in *antiquary*, *antiquarian*, *n.*, *justiciary*, etc.) = *-er*[1]: see *-er*[1].] A suffix of Latin origin, denoting usually a person, and often an agent, but not, like *-er*[1], usually associated with a verb. It appears in *justicer*, *commissioner*, *officer*, *prisoner*, *pensioner*, etc. In many words of more recent formation the suffix may be taken as either *-er*[1] or *-er*[2]. In some words, as *chancellor*, it has assumed the form of Latin *-or*. In words recently formed or taken from the French it appears as *-ier* or *-eer*. In many words it has become merged or is mergeable with the English *-er*[1].

-er[3]. [< ME. *-er*, with suffix of declension *-ere*, often with syncope *-re*, < AS. *-er*, *-or* in adverbs, but in adjectives always with suffix of declension, masc. *-a*, fem. and neut. *-e*, and reg. with syncope *-r-a*, *-r-e;* = OS. *-ir-o* = D. *-er* = OHG. *-ir-o*, *-ro*, MHG. *-ere*, *-er*, G. *-er* = Icel. *-r-i* = Sw. *-r-e* = Dan. *-r-e* = Goth. *-iz-a*, *-ōz-a*, fem. *-iz-ei*, *-ōz-ei*, neut. *-iz-ō*, *-ōz-ō* = L. m. f. *-iōr*, neut. *-ius* (*-iōr*) = Gr. m. f. *-ίων* (*-ιον-*), neut. *-ιον* = Skt. *-īyas* (nom. m. *-īyān*, f. *-īyasī*, n. *-īyas*); a comparative suffix, of the orig. Indo-Eur. form **-ias*. It appears as *-es-* in the superlative suffix *-est*[1], q. v.] A suffix of adjectives, forming the comparative degree, as in *colder*, *deeper*, *greater*, *bigger*, etc., and being cognate with the Latin comparative suffix *-or*, *-ior*, neuter *-us*, *-ius*, represented in English in *major*, *minor*, *minus*, *prior*, *superior*, *inferior*, etc. In *lesser*, *former*, the suffix is cumulative. In *better*, *worse*, *less* (for irregular suffix, see etymology), the suffix is attached to a now non-existing positive. In *upper*, *inner*, *outer*, *utter*, etc., the positive is adverbial. See the words mentioned.

-er[4]. [< ME. *-er-en*, < AS. *-er-ian* (not common) = D. *-er-en* = G. *-er-en*, *-er-n*, etc.] A suffix of verbs, giving them a frequentative and sometimes a diminutive sense, as *patter* from *pat*, *swagger* from *swag*, *flutter* from *float*, *sputter* from *spout*, etc. It is equivalent to and cognate with the frequentative *-le* (that is, *-el*), as in dialectal *pattle* = *patter*, *scuttle* from *scud*, etc. As a formative of new words it is scarcely used.

-er[5]. [< OF. *-er*, *-re*, term. of nouns from inf., < inf. *-er*, *-re*, < L. *-āre*, *-ēre*, *-ere*, inf. suffix of 1st, 2d, and 3d declensions respectively.] A suffix of certain nouns, mostly technical terms of the law (from Old Law French), as *attainder*, *misnomer*, *trover*, *user*, *non-user*, *waiver*, etc. In *endeavor*, *endeavour*, the orig. *-er* is disguised in the spelling.

C., January 1st, in use in Spain until the end of the fourteenth century. Also called *era of the Cæsars*.—**Vulgar era,** or **Christian era,** the era beginning with the birth of Christ; the ordinary count of years in Christian countries; the "years of our Lord," the "years of grace," etc. The abbreviation A. D. (Latin *anno Domini*, in the year of the Lord), or P. C. (Latin *post Christum*, after Christ), is prefixed to the number of years after the epoch, and B. C. (before Christ), or A. C. (Latin *ante Christum*, before Christ), is suffixed to the years before the epoch. The year preceding A. D. 1 is 1 B. C.; but astronomers call the latter year 0, and the year preceding it 1. The vulgar era was invented in the sixth century by Dionysius Exiguus, and came into general use under the Carlovingians. The years were originally and are now considered as beginning January 1st. Dionysius supposed that Jesus Christ was born December 25th, A. D. 1, a date which is now universally considered to be from three to six years too late. It was, however, until this century generally understood that the era was fixed upon the supposition that Christ was born December 25th, 1 B. C. It was for several centuries a common practice to begin the year on March 25th, the day of the Annunciation. The result was that in some places the year, which according to the original and now universal practice would begin on January 1st, was taken to begin on the previous March 25th, while in other places it was taken to begin on the subsequent March 25th. In England the latter method was used. The year was often taken to begin on December 25th. During a part of the seventeenth and eighteenth centuries both years were commonly given to dates between December 25th and the following March 25th: thus, January 9th, $169\frac{9}{3}$. Also called *common era*, *era of Christ*, *era of the Incarnation*. =**Syn. 2.** *Period*, *Age*, etc. See *epoch*.

In *farriery*, a stub, like a piece of soft horn, of about the size of a chestnut, situated behind and below the pastern-joint, and commonly hidden under the tuft of the fetlock.—2. A morbid growth arising from a diseased condition of the ovary of various grasses, caused by a fungus of the genus *Claviceps*. The growth of the fungus begins by the formation of a filamentous mycelium upon the surface of the ovary, which it apparently transforms, retaining approximately its shape. The surface of this tissue is marked by furrows. At this stage conidia are produced upon the tips of short hyphæ; and in this form it was formerly considered a distinct species, under the generic name *Sphacelia* (which has become a common name coordinate with *sclerotium*). When the formation of conidia is at its height, a thick belt of more compact hyphæ is formed at the base of the mass. This assumes a dark-violet color, and continues to grow, pushing upward the sphacelia, which is torn from its attachments, and soon falls off.

1. Cross-section of the ovary (sphacelia), in the early stage of the fungus, showing the mycelium (*a a a*), conidiophores (*b b*), and conidia (*c c*). 2. Ergot on its supporting grass. 3. An isolated ascus from which the filiform spores are escaping. (Figs. 2, 3, and 4 somewhat reduced; 5, magnified; 1, 6, and 7, highly magnified.)

The resulting structure is the *sclerotium* or *ergot*. It is a horn-like mass, often one inch in length. It lies dormant till fall or usually till the following spring, when branches arise in a tuft. Each becomes a stroma, consisting of a stalk and a small head. In the head are formed a number of flask-shaped perithecia, each containing many asci, of which each in turn incloses several filiform spores. The ergot of rye is caused by *Claviceps purpurea*. Ergot is said to cause a sort of gangrene in cattle, especially in the feet. It is used in medicine to cause contraction of the uterus and of the arterioles and as an abortifacient, and also in certain morbid states of the cerebrospinal axis, where its effect may or may not be due entirely to its action on the vessels. Also called *spurred rye*.

Besides the large genera *Erica*, *Rhododendron*, and *Gaultheria*, the family includes such well-known genera as *Kalmia*, *Arbutus*, *Andromeda*, and *Epigæa*. There is but one effective mode of displacing an *error*, and that is to replace it by a conception which, while readily adjusting itself to conceptions firmly held on other points, is seen to explain the facts more completely.

5. The difference between the observed or otherwise determined value of a physical quantity and the true value: also called the *true error*. By *the error* is often meant the error according to some possible theory. Thus, in physics, the rule is to make the sum of the squares of the errors a minimum—that is, that theory is adopted according to which the sum of the squares of the errors of the observations is represented to be less than according to any other theory. The *error of an observation* is separated into two parts, the *accidental error* and the *constant error*. The accidental error is that part of the total error which would entirely disappear from the mean of an indefinitely large series of observations taken under precisely the same circumstances; the constant error is that error which would still affect such a mean. The *law of error* is a law connecting the relative magnitudes of errors with their frequency. The law is that the logarithm of the frequency is proportional to the square of the error. This law holds only for the accidental part of the error, and only for certain kinds of observations, and to those only when certain observations affected by abnormal errors have been struck out. The *probable error* is a magnitude which one half the accidental errors would in the long run exceed; this is a well-established but unfortunate expression. The *mean error* is the quadratic mean of the errors of observations similar to given observations.

6. In *law*, a mistake in a judicial determination of a court, whether in deciding wrongly on the merits or ruling wrongly on an incidental point, to the prejudice of the rights of a party. It implies, without imputing corruptness, a deviation from or misapprehension of the law, of a nature sufficiently serious to entitle the aggrieved party to carry the case to a court of review.

7†. Perplexity; anxiety; concern.

He . . . thought well in his corage that thei were right high men and gretter of astate than he cowde thinke, and a-boute his herte com so grete *errour* that it wete all his visage with teeres of his yien. *Merlin* (E. E. T. S.), ii. 318.

Etymologically, *-er-y* is *-er*[2] (ult. *-er*[1]) with an abstract fem. ending.] A suffix originally of nouns from the French, but now used freely as an English formative. It is added to nouns, adjectives, and sometimes verbs, to form nouns in which the force of the suffix varies. Originally abstract, denoting the collective qualities of the subject (as in *foxery*, *foolery*, *goosery*, *hoggery*, *witchery*, etc.), it has also or only a concrete sense, as in *finery*, *greenery*, etc. In a particular phase of this use it denotes a business, as in *fishery*, *grocery*, *pottery*, etc.; hence it came to refer to wares, etc., collectively, as in *grocery*, now usually in plural *groceries*, *pottery*, *crockery*, etc., and to the place where such wares are made or sold, or to any place of business, as in *grocery*, *pottery*, etc., *cannery*, *fishery*, *tannery*, *tripery*, etc., or to any place where the things represented by the subject are collected, as in *fernery*, *pinery*, *rookery*, etc., especially to places where animals are collected, or to the animals collectively, as in *hennery*, *goosery*, *rookery*, *piggery*, *hoggery*, etc. This termination easily associates with *-er* of whatever origin, especially with *-er*[1] or *-er*[2], denoting a person engaged in business. Compare *fisher* and *fishery*, *grocer* and *grocery*, *potter* and *pottery*, *crocker* and *crockery*, *tanner* and *tannery*, etc. In many cases it appears syncopated as *-ry*, especially in the collective use, as in *citizenry*, *Englishry*, *yeomanry*, etc.

By this contrivance the wheelwork is made to communicate an impulse to the regulating power (which in a clock is the pendulum and in a watch the balance-wheel), so as to restore to it the small portion of force which it loses in every vibration, in consequence of friction and the resistance of the air. The leading requisite of a good escapement is that the impulse communicated to the pendulum be invariable, notwithstanding any irregularity or foulness in the train of wheels. Various kinds of escapements have been contrived: such as the *crown-* or *verge-escapement*, used in common watches, and the *anchor-* or *crutch-escapement*, in common clocks—both also termed *recoiling escapements;* the *dead-beat escapement* and the *gravity-* or *remontoir-escapement*, used in the finer kind of clocks; the *horizontal escapement* or *cylinder-escapement*, the *detached escapement*, the *lever-escapement*, the *duplex escapement*, the *pinwheel escapement*, all used in the finer classes of watches; and the *half-dead escapement*, in which there is a slight recoil. In the horizontal escapement the teeth of a horizontal wheel act upon a hollow cylinder on the axis of the balance, to give the impulse.

Nouns in *-ese* (which are much oftener used in the plural than in the singular) are sometimes popularly regarded as plurals in *-s*, and give rise to singulars like *Chinee*, *Portuguee*. With reference to language, this suffix is sometimes used humorously with the name of a person, as in *Johnsonese*, *Carlylese*, etc., the language or style of Dr. Johnson, Carlyle, etc. In *burgess* the suffix, of earlier introduction, is shortened; in *bourgeois*, of recent introduction, it retains the French form.

The family is now restricted to the single genus *Esox*, the pikes. (See cuts under *Esox*, *optic*, and *scapulocoracoid*.) In Bonaparte's and some other early systems it was equivalent to Cuvier's *Esoces*. Groups approximately or exactly corresponding to *Esocidæ* have been named *Esoces* (Cuvier, 1817), *Esocinæ* (Swainson, 1839), *Esocini* (Bonaparte, 1841), and *Esoxidea* (Rafinesque, 1815). Also called *Lucidæ*.

(*b*) The lip of the special esophageal groove of ruminants.—**Esophageal glands,** numerous small compound racemose crypts or follicles of the esophagus, as of man, lodged in the submucous tissue and opening by excretory ducts upon the mucous surface of the tube. In some cases, as of birds, they are highly specialized and yield a copious milky fluid used to feed the young, as those of the crop of pigeons. This secretion is called *pigeon's milk*. The remarkable proventricular glands of birds, of similar character, yield a digestive fluid like gastric juice.—**Esophageal groove.** See the extract, and *rumination*.

A groove (*œsophageal groove*) which leads from the œsophagus into the reticulum, and is shut off by a valvular process from the first two divisions of the stomach, represents that portion of the œsophagus which has entered into the formation of the stomach and formed the first two portions of that organ by bulging out on one side.
Gegenbaur, Comp. Anat. (trans.), p. 559.

Esophageal opening or **orifice,** the hole in the diaphragm through which the gullet passes with the pneumogastric nerves.—**Esophageal ring,** in *Invertebrata*, a circlet of commissural nerves around the anterior part of the alimentary canal, connecting the cerebral or preoral ganglia with the ventral ganglionic chain. It is a usual structure in annelidous, arthropodous, and many other invertebrate animals, but varies greatly in its details. See *cerebral*. Also known as *esophageal commissures, nerve-ring, nerve-pentagon* (in echinoderms), etc.—**Esophageal teeth,** certain enameled processes of the backbone which project into the gullet of serpents of the subfamily *Dasypeltinæ*. See *Rhachiodontidæ*.

★**esophagus, œsophagus** (ē-sof′a-gus), *n.* [< NL. *œsophagus*, < Gr *οἰσοφάγος*, the gullet, lit. the passage for food, < *οἴσειν*, fut. inf., associated with *φέρειν* = E. *bear*[1], carry, + *φαγεῖν*, eat.] The gullet; the canal through which food and drink pass to the stomach. In man the esophagus is a musculomembranous tube about nine inches long, extending from the pharynx to the stomach. It begins in the neck, where the pharynx is reduced from a funnel to a tube, opposite the fifth intervertebral space, descends vertically upon the front of the spinal column behind the windpipe, traverses the chest in the posterior mediastinum upon the front of the spine, perforates the diaphragm together with the pneumogastric nerves, and ends at the cardiac orifice of the stomach, opposite the ninth dorsal vertebra. It is nearly straight, but has a slight curvature both anteroposteriorly and laterally. Its surgical relations are very important, especially in the neck. The esophagus has two principal coats. The muscular coat is composed of two planes of contractile fibers, the outer longitudinal and the inner circular. They are continuous above with fibers of the inferior constrictor of the pharynx. The muscles in the upper part of the esophagus are red and in part at least striped, but below are pale, unstriped, and "involuntary." The mucous coat is internal, continuous with that of the pharynx above and the stomach below. It is thick, of a reddish color above and paler below, disposed in longitudinal folds or plicæ, which disappear on distention. Its surface is studded with minute papillæ and invested throughout with stratified pavement epithelium. The mucous and muscular coats are loosely connected with each other by a layer of connective tissue, sometimes described as the *areolar coat*, between which and the mucous membrane is a layer of longitudinal unstriped muscular fibers called the *muscularis mucosæ*. The esophagus is well supplied with glands called *esophageal* (which see, and see cuts under *alimentary, diaphragm*, and *mouth*). In lower animals the esophagus, as a canal from the mouth or fauces to the stomach, undergoes numberless modifications of relative size, of shape, structure, and position. It very often presents special dilatations, as the crop or craw of birds, and its lower end, where it enters the stomach, may present special contrivances for conducting food and drink, as the esophageal groove of a ruminant. Special aggregations of esophageal glands are also found.

There grew up, in the minds of some commentators, a supposition of exoteric doctrine as denoting what Aristotle promulgated to the public, contrasted with another secret or mystic doctrine reserved for a few, and denoted by the term *esoteric;* though this term is not found in use before the days of Lucian. I believe the supposition of a double doctrine to be mistaken in regard to Aristotle; but it is true as to the Pythagoreans, and is not without some colour of truth even as to Plato. *Grote.*

He [Josephus] fancied himself to have learned all, whilst in fact there were secret *esoteric* classes which he had not so much as suspected to exist.
De Quincey, Secret Societies, ii.

When there exist two distinct explanations, or statements, about the signification of an emblem, the true one *esoteric*, and known only to the few, the other exoteric, incorrect, and known to the many, it is clear that a time may come when the first may be lost, and the last alone remain. *T. esquire[1] (es-kwīr′), *n.* [< OF. *esquier*, *escuier*, *escuyer*, an esquire, shield-bearer, also a shield-maker, mod. F. *écuyer* = Pr. *escudier*, *escuder*, *escuier* = Sp. *escudero* = Pg. *escudeiro* = It. *scudiere*, *scudiero*, < ML. *scutarius*, a squire, a shield-bearer, shield-maker, < L. *scutum*, a shield: see *scutum*, *scute*, *scutage*, *escutcheon*, *scutcheon*, etc. Hence, by apheresis (though actually older in E.), *squire*, q. v.] **1.** A squire; a young man of gentle birth, who, as an aspirant to knighthood, attended upon a knight. [Archaic.]—**2†.** A shield-bearer or armor-bearer; also applied to various other attendants upon a nobleman. See the extract.

> *Strutt*, Sports and Pastimes, p. 10.

3. A title of dignity next in degree below that of *knight*. In England this title is given to the eldest sons of knights and the eldest sons of the younger sons of peers and their eldest sons in succession, officers of the king's courts and of the household, barristers, justices of the peace while in commission, sheriffs, gentlemen who have held commissions in the army and navy, etc.: but opinions with regard to correct usage vary. There are also esquires of knights of the Bath, each knight appointing three at his installation. The title is now usually conceded to all professional and literary men. In the United States the title is regarded as belonging especially to lawyers. In legal and other formal documents *Esquire* is usually written in full after the names of those considered entitled to the designation; in common usage it is abbreviated *Esq.* or *Esqr.*, and appended to any man's name as a mere mark of respect, as in the addresses of letters (though this practice is becoming less prevalent than formerly). In the general sense, and as a title either alone or prefixed to a name, the form *Squire* has always been the more common in familiar use. See *squire*.

> I am Robert Shallow, sir; a poor *esquire* of this county, and one of the king's justices of the peace.
> *Shak.*, 2 Hen. IV., iii. 2.

> *Esquires* and gentlemen are confounded together by Sir Edward Coke, who observes that every *esquire* is a gentleman, and a gentleman is defined to be one qui arma gerit, who bears coat-armour, the grant of which was thought to add gentility to a man's family. It is indeed a matter somewhat unsettled what constitutes the distinction, or who is a real *esquire;* for no estate, however large, per se confers this rank upon its owner.
> 1 *Broom and Had. Com.* (Wait's ed.), p. 317.

4. A gentleman who attends or escorts a lady in public.—**Esquire bedel.** See *bedel*.

ess, es[1] (es), *n.* [< ME. *es*, *ess*, < AS. *ess*, < L. *es*, the name of the letter S, s, < *e*, the usual assistant vowel in forming the names of letters, + *s*.] **1.** The name of the letter *S*, *s*. It is rarely so written, the symbol *S*, *s*, being used in its stead.—**2.** A large worm: so called from its often assuming the shape of an S. [Prov. Eng.]

-ess. [(1) Early mod. E. also *-esse*, *-isse*, *-is*, < ME. *-esse*, *-isse*, < (*a*) OF. *-esse*, F. *-esse*, (*b*) AS. *-isse* (as in *abbodisse*, abbess), < L. *-issa*, < Gr. *-ισσα* (i. e., *-ι-σσα*, the vowel *ι* and sometimes the first *σ*-, in that case orig. *τ*-, prop. belonging to the stem of the noun), a fem. suffix of adjectives, and nouns from adjectives, orig. compound, < *-κ* (as in *-ι-κό-ς*, L. *-i-cu-s*, E. *-ic*) + *-ya* (as in *-ιο-ς*, L. *-iu-s*, fem. *-ia*, L. *-ia*), both common Indo-Eur. formatives. (2) In some words, as in *empress*, *-ess* is a reduced form of Latin *-trix*, *-tricem*, in E. usually *-tress*, as in *actress*, *directress*, etc., fem. forms usually associated with masc. ones in *-tor*, *-tress* being in popular apprehension equiv. to *-tor* + *-ess* (1).] A suffix theoretically attachable to any noun denoting an (originally masculine) agent, to form a noun denoting a female agent, as *hostess*, *abbess*, *prioress*, *chieftainess*, *authoress*, etc. It is most frequent with nouns in *-er*[1], as *bakeress*, *breweress*, *Quakeress*, etc. In such words as *instructress*, *directress*, *editress*, *mistress*, *visitress*, etc., the suffix is really *-tress* (see *-tress*), but in popular apprehension it is *-ess* added to the termination of the corresponding masculines, *instructor*, *director*, *editor*, *mister* (*master*), *visitor*, etc., such masculines being usually in pronunciation, and sometimes in spelling, assimilated to native English nouns in *-er*, as *directer*, *instructer*, *visiter*, etc., *editor* as if **editer*, etc. In some cases the feminine form exists, while the masculine form is obsolete, as in *governess* (*governor* in a corresponding sense being obsolete); *mistress*, used in some senses without a corresponding use of *mister* or *master*.

essay (es′ā, formerly e-sā′), *n.* [The older E. form is *assay*, q. v.; < ME. *assay*, *asay*, *assai*, *asaie*, trial, attempt, < OF. *asai*, *essai*, *essay* (later only *essai*, > later E. *essay*), mod. The Gr. *ἑξάγιον*, sometimes quoted as the origin of the L. *exagium*, is rare LGr., and is taken from the L. term; it denotes a certain weight, 1½ drachmæ. Popular etym. altered the form to *ἑξάγιον*, as if < *ἑξ* = E. *six*.] **1.** A trial, attempt, or endeavor; an effort made; exertion of body or mind to perform or accomplish anything: as, an *essay* toward reform; an *essay* of strength.

> *Bacon*, To Prince Henry.

> Seneca's Epistles to Lucilius, if one mark them well, are but *Essays*, that is dispersed meditations, though conveyed in the form of epistles. *Bacon*, quoted in Abbott, p. 438.

> The *essay* is properly a collection of notes, indicating certain aspects of a subject, or suggesting thought concerning it, rather than the orderly or exhaustive treatment of it. It is not a formal siege, but a series of assaults, essays, or attempts upon it. It does not pursue its theme like a pointer, but goes hither and thither like a bird to find material for its nest, or a bee to get honey for its comb. *New Princeton Rev.*, IV. 228.

> British chariots have been described by Roman historians as consisting of two kinds, called respectively the covina and the *esseda;* this last from esse, a Celtic word. The former was very heavy and armed with scythes, the latter much lighter, and consequently better calculated for use in situations where it would be difficult to employ the covina. *E. M. Stratton*, World on Wheels, p. 250.

★**essence** (es′ens), *n.* [= D. *essence* = G. *essenz* = Dan. Sw. *essens*, < F. *essence* = Pr. *essentia* = Sp. *esencia* = Pg. *essencia* = It. *essenzia* (obs.), *essenza*, < L. *essentia*, the being or essence of a thing, an artificial formation from *esse* (as if < **essen*(*t-*)*s*, ppr.), to translate Gr. *οὐσία*, being, < *ὤν* (*ὀντ-*), ppr. of *εἰ-ναι* = L. *es-se*, be: see *am* (under *be*[1]), and *ens*, *entity*.] **1.** The inward nature, true substance, or constitution of anything. The Greek *οὐσία* (see the etymology) denotes a subject *in esse*, something whose mode of being corresponds to that of a subject, as distinguished from a predicate, in speech. But while this is the original conception, the word *essence*, even in Latin, usually carries a different sense. The essence is rather the idea of a thing, the law of its being, that which makes it the kind of thing that it is, that which is expressed in its definition. In regard to artificial things, the conception of an essence is usually tolerably clear; thus, the essence of a bottle is that it should be a vessel with a tubular orifice. Those philosophers who speak of the essences of natural things hold that natural kinds are regulated by similar ideas. Nominalists hold that definitions do not belong to things, but to words; and accordingly they speak of the essences of words, meaning what is directly implied in their definitions.

> Justice in her very *essence* is all strength and activity.
> *Milton*, Eikonoklastes, xxviii.

> First, *essence* may be taken for the being of anything, whereby it is what it is. And thus the real internal, but generally in substances unknown, constitution of things, whereon their discoverable qualities depend, may be called their *essence*. . . . Secondly, . . . but, it being evident that things are ranked under names into sorts or species only as they agree to certain abstract ideas, to which we have annexed those names, the *essence* of each genus or sort comes to be nothing but that abstract idea which the general or sortal (if I may have leave so to call it from sort, as I do general from genus) name stands for. And this we shall find to be that which the word *essence* imports in its most familiar use. These two sorts of *essences*, I suppose, may not unfitly be termed, the one the real, the other the nominal, *essence*.
> *Locke*, Human Understanding, III. iii. 15.

Whatever makes a thing to be what it is, is properly called its *essence*. Self-consciousness, therefore, is the *essence* of the mind, because it is in virtue of self-consciousness that the mind is the mind—that a man is himself.
Ferrier.

But when in heaven she shall his *essence* see,
This is her soveraigne good and perfect blisse.

5. An elementary ingredient or constituent; anything uncompounded: as, the fifth *essence* (that is, the fifth element in the philosophy of Aristotle, or the upper air, the other four being, in their order, earth, water, air, and fire). See *quintessence*.

Bacon.

6. Anything of ethereal, pure, or heavenly substance; anything immaterial. [This meaning is derived from the use of *fifth essence* for the ether or upper air (see def. 5).]

The scales are taken from the fish, left in water until the slimy matter adhering to them settles, then rubbed down in a mortar with fresh water, and strained through a linen cloth. Ammonia is added, both to prevent decomposition and, by its volatilization, to aid in coating the pearls, whether the nacreous film is to be on the interior surface of a blown pearl or on the exterior of a bead of glass or paste, as for Chinese or Roman pearls.

Essenes (e-sēnz′), *n. pl.* [Formerly also *Essens*; < LL. *Esseni*, < Gr. Ἐσσῆνοι, also Ἐσσαῖοι, the Essenes. The origin of the name is unknown. See *Assidean*.] A community of Jews in Palestine formed in the second century B. C., originally representing a tendency rather than constituting an organized sect, and aiming at a higher degree of holiness than that attained by other Jews. Later they were organized into a sort of monastic society, bound together by oaths to piety, justice, obedience, honesty, and secrecy. According to Philo, their conduct was regulated by three rules—"the love of God, the love of virtue, and the love of man." They rejected animal sacrifices, but were strict in their observance of the non-Levitical Mosaic law. They were ascetics and generally celibates. They never extended, as a body, beyond the bounds of Palestine, and disappeared after the destruction of Jerusalem.

5. In *law*: (*a*) The legal position or status of an owner, considered with respect to his property; ownership, tenancy, or tenure; property in land or other things. When the thing in question is an immovable, such as land, etc., the estate, if a fee, or for a life or lives, is termed *real*. (See *real*.) If it is only for a term of years, or relates only to movables, it is termed *personal*.

Land was once not regarded as property at all. People owned not the land, but an *estate* in the land; and these *estates* still continue to haunt, like ghosts, the language of real property law.
Sir J. F. Stephen, National Rev., Laws relating to Land.

(*b*) More technically, and with relation only to land, the degree or quantity of interest, considered in respect to the nature of the right, its period of duration, or its relation to the rights of others, which a person has in land. If that interest, in a given case, does not amount to an absolute entire ownership, it is because there is at the same time another interest in the same thing pertaining to other persons. Thus, one man may have the ultimate right of property, another the right of possession, and a third actual possession: each of these interests being *qualified* or *incomplete estates*, which, if transferred to and merged in one person, would constitute an *absolute estate* or fee simple. (See *merger*.) Such special estates are said to be carved out of the fee. A *future estate*—that is, one which is not to be enjoyed until a future time—is nevertheless deemed to have a present existence in anticipation, even if it may never take effect, or if it is wholly uncertain who will be its owner: it is, in such case, called a *contingent estate*. *N. Y. Rev. St.*, III. 2175, § 5.

The grant of land to a man, without specifying what *estate* he is to take, will to this day give him no interest beyond his own life. *F. Pollock*, Land Laws, p. 55.

6. Property in general; possessions; particularly, the property left at a man's death: as, at his death his *estate* was of the value of half a million; the trustees proceeded to realize the *estate*.

The Great Frost (Arber's Eng. Garner, I. 89).

No need to sweat for gold, wherewith to buy
Estates of high priz'd land. *Quarles*, Emblems, v. 9.

But that old man, now lord of the broad *estate* and the Hall,

9. One of the orders or classes into which the population of some countries is or has been divided, with respect to political rights and powers. In modern times this division has been into nobility, clergy, and people (now, in Great Britain, lords temporal and spiritual and commons), called the *three estates*. Formerly in France a legislative assembly representing the three estates, called the *states-general*, was summoned only in emergencies; the last began the revolution of 1789.

When the crowned Northman consulted on the welfare of his kingdom, he assembled the *estates* of his realm. Now an *estate* is a class of the nation invested with political rights. There appeared the *estate* of the clergy, of the barons, of other classes. In the Scandinavian kingdom to this day the *estate* of the peasants sends its representatives to the diet. *Disraeli*.

The United Kingdom of Great Britain and Ireland is governed by its king or queen and two Houses of Parliament. These are commonly known as the "Three *Estates* of the Realm"; but this phrase properly applies to the three classes of which Parliament is composed, viz., the Lords Spiritual, the Lords Temporal, and the Commons.
A. Fonblanque, How we are Governed, p. 11.

10†. A person of high station or rank; a noble.

Richard, Duke of Gloucestre, [was] . . . harde fauoured of vysage, such as in *estates* is called a warlike vysage, and amonge commen persons a crabbed face.
Quoted in *N. and Q.*, 7th ser., II. 314.

Same as *cap of maintenance* (which see, under *maintenance*).—**Cloth of estate.** See *cloth*.—**Conditional estate**, or **estate upon condition**, an estate the existence of which depends upon the happening or not happening of some uncertain event, whereby the estate may be either originally created or enlarged, or finally defeated. *Blackstone*. See *condition*, 8.—**Conventional estates.** See *conventional*.—**Convention of estates.** See *convention*.—**Equitable estate or title**, a right to claim the profits or enjoyment of ownership from the person who holds the legal title as trustee; a beneficial interest, recognized by courts of equity as belonging to one person, while the legal title—that is, the title recognized by courts of common law—is in another person. Thus, sometimes a trustee is said to hold the legal title to the trust property, and the beneficiary an equitable estate or title.—**Estate at will**, that estate held by one who is in possession of the land of another by his consent, and holds it at the will of the latter, or at the will of both parties.—**Estate by statute.** See *statute*.—**Estate by sufferance.** See *sufferance*.—**Estate by the courtesy.** See *courtesy of England* (under *courtesy*).—**Estate for life**, an estate limited to a man to hold the same for the term of his own life, or for that of any other person, or for more lives than one. (*Stephen*.) When used without qualification, the phrase usually implies tenancy for one's own life.—**Estate for years**, an estate which, by the terms of its creation, is measured by the lapse of a specified period of time (it may be a fraction of a year or more), so that it must expire by a certain date. An *estate for years* is often called a *term*.—**Estate in common.** See *tenancy*.—**Estate in expectancy.** See *expectance*.—**Estate in fee.** See *fee*[2].—**Estate in joint tenancy**, an estate held, whether in fee, for life, for years, or at will, by several persons jointly (as distinguished from an *estate in severalty*, or held separately). Its characteristics are that it was created as a single estate, in which the owners were conjoined (*unity of estate*), and must therefore owe its origin to one act or deed (*unity of title*), the interest of each commencing at the same time (*unity of time*), and the possession of either being legally equivalent to the possession of all (*unity of possession*). It follows from these qualities that on the death of one the entire estate remains in the others, who are said to take by *right of survivorship*. A conveyance by one of his interest terminates the joint character of the interest conveyed, because the unities are not preserved, and the transferee, if a stranger, is a tenant in common. To illustrate the distinction, trustees hold as joint tenants, heirs as tenants in common. See *tenancy*.—**Estate in possession.** See *possession*.—**Estate in severalty.** See *severalty*.—**Estate in tail**, an estate in fee cut down (*taillé*) by restricting it to certain descendants or classes of descendants, leaving usually a right of reëntry in the creator of the estate, in the event of the failure of such descendants. See *tail* and *entail*.—**Estate of inheritance**, an estate that on the death of the owner survives, and if he dies intestate passes to his heirs. One subject to a condition that might prevent its passing (as where the lord's consent was necessary) has been termed an *estate of inheritance qualified*.—**Estate tail female**, an estate limited to females and female descendants of females.—**Estate tail general**, an estate limited to the heirs of the donee's body generally, without restriction, in which case it would descend to every one of his lawful posterity who could take in due course.—**Estate tail male**, an estate limited to males and male descendants of males, thus securing that the land should always be owned by one of the same surname as the ancestor.—**Estate tail special**, an estate limited to certain heirs of the holder's body, usually the issue of a particular marriage.—**Executed estate**, an estate in possession, as distinguished from an *executory estate*, which depends on some contingency for coming into existence in enjoyment in the future.—**Executory estate**, a future estate which is contingent, but yet is not necessarily dependent, for its commencement in possession upon the time when some precedent estate shall have terminated, as distinguished from one which is limited to take effect on the termination of a precedent estate, and is termed a *remainder*. See *executory devise*, under *devise*, and *remainder*.—**Expectant estate.** See *expectance*.—**Fourth estate.** (*a*) A name for the lowest classes of society, as the artisans, servants, day-laborers, etc., as distinguished from the third estate or commons; the proletariat. (*b*) A name humorously given in recent times to the newspaper press, or the body of journalists, as constituting a power in the state distinct from that of the three recognized political orders.—**Freehold estate.** See *freehold*.—**Future estate.** See def. 5 (*b*).—**Landed Estates Court.** See *court*.—**Legal estate.** See *equitable estate*, and *legal*.—**Merger of estates.** See *merger*.—**Particular estate**, the estate, usually a lesser one, that precedes a remainder. See *particular*.—**Settled Estates Act.** See *settle*.—**Third estate**, the common people in their relations to the state or to political power: a phrase made famous by the struggles of the representatives of this order (the *tiers état*) in the last French states-general for power equal to that of both the other orders, and their final assumption of supreme authority, consummating the great revolution.—**Vested estate**, an estate in which there is an immediate right of present enjoyment or a present fixed right of future enjoyment, or in regard to which, if all precedent estate should instantly terminate, the right to enjoyment would immediately be in an existing person. If, however, notwithstanding such supposed termination, the right of enjoyment would still depend on an unascertained contingency, the estate is said to be *contingent*.

=**Syn 1 and 2.** *Estimate*, *Esteem*, *Estimation*, *Respect*, *Regard*; honor, admiration, reverence, veneration. *Estimate*, both as noun and as verb, supposes an exercise of the judgment in determining external things, as amount, weight, size, value; or internal things, as intellect, excellence. It may be applied to that which is unfavorable: as, my *estimate* of the man was not high. *Esteem* as a noun has commonly the favorable meanings of the verb; it is a moral sentiment made up of respect and

attachment, the result of the mental process of reckoning up the merits or useful qualities of a person: as, he is held in very general *esteem*. *Estimation* has covered the meanings of both *estimate* and *esteem*. *Respect* is commonly the result of admiration and approbation: as, he is entitled to our *respect* for his abilities and his probity; it omits, sometimes pointedly, the attachment expressed in *esteem*. *Regard* may include less admiration than *respect* and be not quite so strong as *esteem*, but its meaning is not closely fixed in quality or degree.
